(15) Position 1st stage HPT seal (1007/1) into channel in upper OD of 2nd stage HPT airseal (1007/2) cut seal as required to obtain end gap of 0.025 − 0.225 inch (0.6 − 5.7 mm). Apply Beeswax P05−395 or Paraffin Wax Blend P05−396 or Adhesive P08−005 or Adhesive P08−010 or Adhesive P08−022, as required to maintain seal in position. Adhesive is not allowed outside of Area M as shown in Figure 1007.

(16) Attach a hoist with PWA 85086 Arm to PWA 86080 Eye or PWA 85085 Plate as applicable.

(17) Lift assembly and attach a second hoist and PWA 85086 Arm to PWA 85087 Eye or PWA 85083 Eye as applicable.

(18) Use both hoists to trunnion assembly to front, hub end up, position. Remove the lower hoist and arm and the PWA 86080 Eye or PWA 85085 Plate. Lower the hub onto a suitable support.

(19) Remove the hoist, arm, and lifting eye from the hub.

(20) Heat the front end of the hub as follows:

NOTE: Heating the turbine front hub is optional for hubs that are (Pre SB PW4ENG 72−451) but can be used based on the operators experience.

CAUTION: THE TEMPERATURE PROBE MUST TOUCH THE HUB OR OVERHEATING OF THE HUB CAN OCCUR.

(a) Put PWA 87487 Heater onto the front end of the hub. Connect PWA 29754 Heater Control to the heater and heat to 300°F (148.9°C).

(b) Remove the heater and control.

(21) Install PWA 85087 Eye or PWA 85083 Eye to the hub, and connect a hoist with PWA 85086 Arm to the eye as previously specified.

(22) Put the 1st stage turbine rotor assembly on the turbine intermediate hub. See Figure 1008.

(a) Connect a hoist with PWA 85086 Arm to the PWA 85087 Eye or PWA 85083 Eye.

(b) Use the hoist to position the turbine front hub (1008/2) over the turbine intermediate hub (1008/4). Position the rotor unbalance marks 180 degrees apart and lower the turbine front hub onto the turbine intermediate hub.

(c) Remove the hoist, arm, and eye.

(d) Align the mating turbine hub lock lugs (1008/9) on the ID of the turbine intermediate hub and the turbine front hub.

(e) Install the detail−4 spline of the PWA 85111 Align Fixture and align the splines with the splines of the intermediate hub.

(f) Align the key (1008/5) in the detail−3 flanged spline (1008/1) with the keyway in the detail−4 spline (1008/3). Install the flanged spline into the ID of the turbine front hub.

NOTE: You can turn the turbine front hub slightly to align the turbine hub lock lugs, and the key with the mating keyway. You must keep the rotational movement to a minimum.

(g) Press the flanged spline down until it touches the front face of the turbine front hub.

(h) Remove the flanged spline from the turbine front hub.

Subtask 72−52−00−430−055:

(23) Position the turbine hub lock (1008/8) over the mating lugs between the turbine front hub and intermediate hubs.

Subtask 72−52−00−430−056:

(24) Install the flanged spline (1008/1) into the turbine front hub and spline (1008/3).

(25) Remove the storage nut detail if installed and insert the rod (1008/7) through the center of both splines and thread it into the coupler (1008/6) of PWA 85107 Fixture.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(26) Connect PWA 75028 Gage and PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to hydraulic cylinder of PWA 85107 Fixture. Actuate hydraulic pump and apply load of 18,000 lbf. (80,068 N) to seat front and intermediate hubs.

NOTE: For a 30 ton hydraulic cylinder, a hydraulic pump output of 2,493 psig (17,188.6 kPa) will apply a load of 18,000 lbf. (80,068 N).

NOTE: For a 60 ton hydraulic cylinder, a hydraulic pump output of 1,358 psig (9,363.1 kPa) will apply a load of 18,000 lbf. (80,068 N).

Subtask 72-52-00-430-057:

(27) Using access holes in flanged spline detail, snap turbine hub lock into position over mating lugs in ID of hubs.

(28) Release hydraulic load. Unthread rod (1008/7) from coupler (1008/6). Remove flanged spline and spline.

(29) Insert rod through center of flanged splines. Thread storage nut detail onto end of rod to retain parts.

Subtask 72-52-00-430-058:

(30) Optional, install PWA 85112 Retaining Fixture.

(a) Rotate knurled nut to retract retainer details of fixture.

(b) Insert fixture into turbine hub ID and align retainer details of fixture with ID of turbine hub lock.

(c) Rotate knurled nut to expand fixture against turbine hub lock.

Subtask 72-52-00-430-061:

(31) If not previously accomplished, check 1st stage HPT blade tip clearance using feeler stock. Blade tip clearance must be in limits specified in 72-52-00, Inspection/Check-04 Task 72-52-00-990-004, Reference 1740.

Subtask 72-52-00-430-063:

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(32) Connect PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools on PWA 85107 Fixture. Using hoist, lift assembly and trunnion to front (hub) end down position.

(33) Position the locating plug detail (triple step end up) into the center hub of PWA 87022 Stand.

(34) Lower high pressure turbine into stand, with turbine front hub on locating plug and front flange of turbine case on flange of stand.

(35) Adjust the center locating plug of the storage stand to maintain the running clearance of the turbine rotors. Secure the assembly in the stand.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(36) Remove PWA 85107 Fixture from the HPT.

(37) Remove hoist, sling and adapters.

(38) If the turbine assembly will be moved while in PWA 87022 Stand, install PWA 86058 Retainer to prevent damage to the knife−edge seals. See Figure 1009.

(a) Put the retainer onto the rear flange of the turbine intermediate hub.

(b) Align the boltholes and secure the outer flange of the retainer with 14 detail screws and nuts.

Subtask 72−52−00−430−062:

(39) If not previously accomplished, check 2nd stage HPT blade tip clearance using feeler stock. Blade tip clearance must be in limits specified in 72−52−00,
R Inspection/Check−04 Task 72−52−00−990−004, Reference
R 1741.

HIGH PRESSURE TURBINE (HPT) - STORAGE-01

Task 72-52-00-530-001:

1. Pack High Pressure Turbine

A. Equipment And Materials Required

Special Tools:

PWA 28657	Sling
PWA 76156	Adapter
PWA 85107	Fixture

Consumable Materials:

Item No. Designation

NOTE: The following items not normally supplied by container manufacturer.

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-156	Seal, Lead
P15-001	Dehydrator

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS20995-C41		

Packaging Equipment:

NOTE: The following table lists assembly number, dimensions, and gross weight for high pressure turbine shipping container available from Pratt & Whitney. Further information can be obtained from:

Commercial Parts Support
Commercial Engine Business
Pratt & Whitney
400 Main St
East Hartford, CT 06108

Container Assembly No.	Dimensions	Approximate Gross Weight Including High Pressure Turbine
P60033	67 Inch (1701.800 mm) x 67 Inch (1701.800 mm) x 60.5 Inch (1536.700 mm)	1,592 lbs (722.12 Kg)

B. Procedure

(1) If necessary, remove nuts and screws that attach PWA 86058 Retainer to the rear flange of the turbine case. Remove the retainer.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(2) Install PWA 85107 Fixture onto high pressure turbine. See Figure 1201.

(a) If installed, remove rod and attached details, guide pilot, clamp and nuts from coupler. Remove nut and hydraulic cylinder. Remove plug.

(b) Remove 12 screws (1201/10) securing plate (1201/1) to piloting ring (1201/7) of fixture. Remove retainer (1201/9) and jaws (1201/2).

(c) For engines (Pre SB PW4ENG 72−176), remove the PWA 86379 Adapter Ring, if installed, from the pilot ring detail of PWA 85107 Fixture.

CAUTION: THE SCREWS THAT HOLD THE PWA 86379 ADAPTER RING MUST BE FLUSH WITH THE ADJACENT SURFACE OR DAMAGE TO THE PARTS CAN OCCUR.

(d) For engines (Post SB PW4ENG 72−176), install the PWA 86379 Adapter Ring, if not installed, on the pilot ring detail of PWA 85107 Fixture. Use six detail cap screws to hold the adapter ring.

NOTE: The turbine intermediate hub, (Post SB PW4ENG 72−176) has a shorter inner hub. The adapter is required with the fixture to set the axial run position on the HPT rotor.

(e) Loosen eight hand knobs (1201/6) at center hub (1201/8) of fixture and move piloting ring (1201/7) rearward until it is flush with or above surface of center hub. Tighten eight hand knobs.

(f) Thread three .500−13 inch eyebolts into tapped holes in rear center hub of fixture. Attach standard three cable sling to eyebolts and position fixture onto rear of high pressure turbine.

(g) Secure outer flanges of fixture to high pressure turbine case using 26 detail screws (1201/5) and spacers (1201/4). Remove hoist and sling.

(h) Loosen eight hand knobs (1201/6) at center hub and allow piloting ring (1201/7) to slowly seat onto turbine rear hub. Tighten eight hand knobs to secure hub.

(i) Position four jaws (1201/2) into center of fixture, locating lip of jaws in ID cutout of turbine hub. Lightly tighten screws (1201/3) to secure jaws.

(j) Install retainer (1201/9) into center of fixture to retain four jaws (1201/2). Tighten four screw details of jaws.

(k) Install plate (1201/1) to pilot ring (1201/7) and secure with 12 screws (1201/10).

(3) Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of fixture. Take up slack on sling cables.

(4) Remove top half of P60033 Container Assembly.

(a) Actuate relief valve on side of container to release pressure before opening container.

(b) Loosen nuts securing container flange bolts, and rotate bolts 1/4 turn.

(c) Connect suitable sling to lifting rings on top cover of container. Using hoist, remove top cover of container.

(5) Using hoist position turbine, front end down, over P60033 Container Assembly. See Figure 1202.

(6) Align centers of bosses on turbine case with arrows marked on OD of lower support detail of container. Align dowel pins in support with boltholes in case.

(7) If installed, remove PWA 85112 Retaining Fixture from ID of turbine hubs.

(8) Ensure that segmented rubber retainer is in position in center of container lower support.

(9) Lower turbine onto lower support. Ensure that segmented rubber retainer in center of lower support pilots in ID of turbine front hub.

(10) Secure front flange of case to lower support with 26 flat washers (1202/8), lockwashers (1202/7) and cap screws (1202/6).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(11) Remove PWA 85107 Fixture from turbine.

  (a) Remove 12 screws (1201/10) securing plate (1201/1) to fixture. Remove plate.

  (b) Remove retainer (1201/9) from ID of fixture.

  (c) Loosen screws (1201/3) and carefully remove four jaws (1201/2) from ID of fixture.

  (d) Using hoist and suitable sling, remove fixture from rear of turbine.

(12) Carefully install upper support (1202/4), into ID of turbine intermediate hub and seat on ID lip of hub.

(13) Secure upper support to lower support with bolt (1202/1), threads lubricated with Engine Oil P03−001, lockwasher (1202/2) and flat washer (1202/3) under bolthead. Torque bolt to 850 − 950 lb−in. (96.037 − 107.336 N.m).

(14) Connect hoist to lifting rings on top cover of container, and position top cover over bottom of container. Align dowel pins with dowel pin holes and lower top cover onto bottom half of container.

(15) Secure container using detail bolts and nuts.

(16) Install lockwire, MS20995−C41 through holes in cover flange and attach Lead Seal P05−156. Using bull dog pliers, compress seal on wire and cut off excess wire.

(17) Inspect condition of Dessicant P15−001 and replace as required.

Task 72−52−00−540−001:

2. Unpack High Pressure Turbine

A. Equipment And Materials Required

Special Tools:

PWA 28657	Sling
PWA 76156	Adapter
PWA 85107	Fixture
PWA 85112	Fixture, Retaining
PWA 87022	Stand, Storage

B. Procedure

(1) Break and remove lockwire and seal from container flange.

(2) Remove top half of P8320 Container Assembly.

  (a) Actuate relief valve on side of container to release pressure before opening container.

  (b) Loosen nuts securing container flange bolts, and rotate bolts 1/4 turn.

  (c) Connect suitable sling to lifting rings on top cover of container. Using hoist, remove top cover of container.

(3) Remove bolt (1202/1), lockwasher (1202/2) and flat washer (1202/3) securing upper support (1202/4) to lower support (1202/9) of container.

(4) Remove 26 cap screws (1202/6), lockwashers (1202/7) and flat washers (1202/8) securing turbine case to lower support.

Figure 1202
(Task 72−52−00−530−001)

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(5) Install PWA 85107 Fixture onto high pressure turbine. See Figure 1201.

(a) If installed, remove rod and attached details, guide pilot, clamp, and nuts from coupler. Remove nut and hydraulic cylinder. Remove plug.

(b) Remove 12 screws (1201/10) securing plate (1201/1) to piloting ring (1201/7) of fixture. Remove retainer (1201/9) and jaws (1201/2).

(c) Loosen eight hand knobs (1201/6) at center hub (1201/8) of fixture and move piloting ring (1201/7) rearward until it is flush with or above surface of center hub. Tighten eight hand knobs.

(d) Thread three .500−13 inch eyebolts into tapped holes in rear center hub of fixture. Attach standard three cable sling to eyebolts and position fixture onto rear of high pressure turbine.

(e) Secure outer flanges of fixture to high pressure turbine case using 26 detail screws (1201/5) and spacers (1201/4). Remove hoist and sling.

(f) Loosen eight hand knobs (1201/6) at center hub and allow piloting ring (1201/7) to slowly seat onto turbine rear hub. Tighten eight hand knobs to secure hub.

(g) Position four jaws (1201/2) into center of fixture, locating lip of jaws in ID cutout of turbine hub. Lightly tighten screws (1201/3) to secure jaws.

(h) Install retainer (1201/9) into center of fixture to retain four jaws (1201/2). Tighten four screw details of jaws.

(i) Install plate (1201/1) to pilot ring (1201/7) and secure with 12 screws (1201/10).

(6) Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapter to trunnion spools of fixture. Take up slack on sling cables.

(7) Using hoist, remove turbine from container. Ensure that segmented rubber retainer remains in position in center of container lower support.

NOTE: Do not store upper support (1202/4) in position in segmented rubber segment in center of container assembly or distortion of rubber segments may occur.

(8) Place turbine front end down into PWA 87022 Storage Stand. See Figure 1201.

(9) Adjust center plug of storage stand to maintain running distance (clearance) of turbine rotors and secure assembly in stand.

(10) Remove fixture from turbine.

- (a) Remove 12 screws (1201/10) securing plate (1201/1) to piloting ring (1201/7).
- (b) Remove retainer (1201/9) from ID of fixture.
- (c) Loosen screws (1201/3) and carefully remove four jaws (1201/2) from ID turbine intermediate hub.
- (d) Remove 26 screws (1201/5) and spacers (1201/4) securing fixture to rear flange of turbine case.

(11) Install PWA 85112 Retaining Fixture.

- (a) Rotate knurled nut to retract retainer details of fixture.
- (b) Insert fixture into turbine hub ID and align retainer details of fixture with ID of turbine hub lock.
- (c) Rotate knurled nut to expand fixture against turbine hub lock.

(12) If the turbine assembly will be moved while in PWA 87022 Stand, install PWA 86058 Retainer to prevent damage to the knife−edge seals. See Figure 1203.

(a) Put the retainer onto the rear flange of the turbine intermediate hub.

(b) Align the boltholes and secure the outer flange of the retainer with 14 detail screws and nuts.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - High Pressure Turbine (HPT)

72−52−03 ASSEMBLY−02	1001/1002	ALL	OCT 15/89

Task 72-52-01-040-001:

1. Disassemble 1st Stage Turbine Rotor Assembly

A. Equipment And Materials Required

Special Tools:

	PWA 25672	Control, Heater (Optional to PWA 29754)
	PWA 29754	Control, Heater
R R	PWA 78176	Socket, Special (First Stage HPT Airseal Bolts, Post SB PW4ENG 72-504)
	PWA 85083	Eye, Handling (Optional to PWA 85087)
	PWA 85085	Plate, Trunnioning (Optional to PWA 86080)
	PWA 85086	Arm, Lifting (Two Necessary)
	PWA 85087	Eye, Lifting
	PWA 85090	Fixture, Remove (Engines without SB PW4ENG 72-487)
	PWA 85091	Heater, Electrical
	PWA 85093	Puller, Knocker
	PWA 85094	Puller, Mechanical
	PWA 85634	Fixture, Support
	PWA 86080	Eye, Lifting
	PWA 86505	Wrench, Ratchet (Optional)
	PWA 87112	Fixture, Remove (Engines with SB PW4ENG 72-487 and all Phase III Engines)
	PWA 87121	Ring, Adapter (Optional to PWA 85634)
	PWA 87390	Jackscrew Puller (For engines with 1st Stage HPT (inner) airseal)
	PWA 87751	Adapter, Torque

Consumable Materials:

Item No.	Designation
P05-102	Ice, Dry

B. Procedure

(1) Trunnion the front turbine hub to the front end down position. Use PWA 85087 and PWA 86080 Eye. See Figure 501.

NOTE: See the following step to trunnion the hub with optional PWA 85083 Eye and PWA 85085 Plate.

(a) Loosen the three locknuts (501/5) of PWA 85087 Eye. Turn the clamp assemblies (501/9) to align the pins so that they point toward the center of the lifting hub (501/4).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the lifting hub (501/4). Hold the clamps in position and tighten the three locknuts (501/5) to hold the eye on the turbine hub.

(c) Attach a hoist to PWA 85086 Arm. Remove the safety pin (501/3) and knurled nut (501/2) from the arm. Connect the arm to the lifting hole (501/1) of the PWA 85087 Eye, and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.

(d) Align the lifting hole of PWA 86080 Eye with the lifting hole of PWA 85087 Eye, and the posts (501/6) with the mating holes in PWA 86080 Eye.

(e) Install the applicable (shorter) bolts (501/7) to hold the PWA 86080 Eye.

(f) Attach a hoist to a second PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the PWA 86080 Eye and secure it with the knurled nut and safety pin.

(g) Trunnion the assembly to the front end down position.

(2) Optional, trunnion the front turbine hub to the front end down position. Use PWA 85083 Eye and PWA 85085 Plate. See Figure 501.

(a) Rotate the outer sleeve (501/12) and separate the outer sleeve from the inner ring (501/10).

(b) Position the inner ring onto the turbine front hub with three jaws (501/11) behind the step on the OD of the hub.

(c) Position the outer sleeve over the inner ring. Align the three dowel pins (501/14) in the inner ring with the mating slots in the outer sleeve.

(d) Rotate the outer sleeve to position the dowel pins in the bottom of the slots. Align the scribed alignment marks (501/13) on the outer sleeve with the scribed lines on the dowel pins.

R
R

(e) Attach a hoist to PWA 85086 Arm. Remove the safety pin and the knurled nut from the arm. Connect the arm to the lifting hole of the eye, and secure it to the eye with the knurled nut and safety pin. Use the hoist to lift the assembly.

(f) Position PWA 85085 Plate into the rear ID of the hub. Align the boltholes and thread two bolts (501/15) into the detail nuts on the upper end of PWA 85083 Eye. Tighten the bolts to secure the plate.

(g) Attach a hoist to a second PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the lifting hole of the plate, and secure it with the knurled nut and safety pin.

(h) Trunnion the assembly to the front end down position.

(3) Remove the lower hoist and PWA 85086 Arm. Lower the assembly into PWA 85634 Fixture.

(4) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the lower hoist and the PWA 85086 Arm. Lower the assembly into the PWA 87121 Adapter Ring.

(5) Remove the upper lifting arm and hoist.

(6) Use PWA 85094 Puller to remove the 2nd stage HPT airseal (502/6). See Figure 502.

(a) Loosen the nuts (502/3) on eight pullers (502/4).

(b) Rotate the pullers clockwise to position the feet of the pullers toward the ID of puller.

(c) Position the puller over airseal. Use a suitable three cable sling.

(d) Rotate the puller feet counterclockwise until they contact the dowel pin stops.

(e) Evenly tighten nuts (502/3) while holding flats of studs to prevent rotation of the puller feet to remove airseal.

(f) Remove the puller. Remove the airseal from the turbine front hub (502/5).

STAGE 1 TURBINE ROTOR ASSEMBLY - DISASSEMBLY-01

(7) Remove airseal (503/2) and seals (503/3). See Figure 503.

(8) Position a suitable blade support over the blades to prevent them from dropping out during the following trunnioning procedure. Secure support to hub.

(9) Use a hoist to attach the PWA 85086 Arm to PWA 86080 Eye or PWA 85085 Plate.

(10) Use the hoist to lift the rotor assembly. Attach a second hoist and PWA 85086 Arm to PWA 85087 Eye or PWA 85083 as applicable.

(11) Use both hoists to trunnion the rotor assembly to rear end down position. Remove the lower hoist and arm. Lower the assembly over the work table.

(12) Carefully remove the blade support.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY FORCE REQUIRED TO REMOVE BLADES FROM HUB BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTIONS OF ALL BLADES CAN BE DAMAGED IF STRUCK.

CAUTION: BLADES ARE MADE OF PWA 1480 OR PWA 1484 SINGLE CRYSTAL MATERIAL. AVOID BLADE CONTACT WITH ANY LUBRICANTS OR BLADE CRACKS CAN OCCUR.

(13) Remove blades (504/1) from hub. Remove 1st stage HPT blade damper (504/3) and 1st stage blade seal (504/2) from cavity between blade roots. See Figure 504.

(14) Remove 1st stage HPT covers (504/4) from OD of hub.

(15) Position PWA 85091 Heater on bench. Connect PWA 25672 or PWA 29754 Heater Control to heater.

(16) Remove the PWA 86080 Eye or PWA 85085 Plate from the hub.

(17) Use the hoist and PWA 85086 Arm to put the turbine hub, front end up, onto the heater. Remove the hoist and arm.

(18) Remove the PWA 85087 Eye or PWA 85083 from the hub.

(19) FOR THESE MODELS: 4152, 4156A, 4158
Remove 1st stage HPT airseal (505/2). See Figure 505.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Use PWA 87751 Adapter with the proper wrench to remove the nuts (505/5) and washers (505/4). You can use the optional PWA 86505 Ratchet Wrench to remove the nuts. Remove the bolts (505/1) and counterweights as applicable.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Loosen hand knob detail of PWA 85093 Knocker Puller to open jaws. With hand knob facing outward, position jaw of puller around upper knife−edge seal. Tighten hand knob to attach puller to airseal. Use the slide hammer action and move the puller to several locations around airseal, remove airseal from turbine front hub. Remove puller from airseal.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Store airseal in suitable protective container.

(20) FOR THESE MODELS: 4152, 4156A, 4158
Remove the 1st stage HPT airseal (506/6) from the turbine front hub (506/4) (Engines without SB PW4ENG 72−487). See Figure 506.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Position PWA 85090 Fixture on a work bench. Loosen and slide the clamp details (506/9) outward. Retract the jackscrews (506/5). Remove the clamps (506/8) from the fixture.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
DO NOT DAMAGE KNIFE−EDGE SEALS OF THE AIRSEAL WHEN INSTALLING FIXTURE.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Loosen the bolts (506/2) that secure the ring (506/7) to base (506/1) and allow ring to seat on the airseal.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Slide clamp (506/9) behind the airseal upper knife−edge seal land and secure with bolts (506/3).

(d) FOR THESE MODELS: 4152, 4156A, 4158
Attach clamps (506/8) to the ring and outer flange of the airseal.

(e) FOR THESE MODELS: 4152, 4156A, 4158
Seat jackscrews to apply preload to the airseal.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Tighten the bolts (506/2) to secure the ring (506/7) to the fixture base.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
MAKE SURE THAT THE TEMPERATURE PROBE IS IN CONTACT WITH THE TURBINE HUB OR THE HUB CAN BECOME TOO HOT.

(g) FOR THESE MODELS: 4152, 4156A, 4158
Heat parts to 300°F (148.9°C) maximum. Use Dry Ice P05−102 on the airseal to help to remove it from the turbine hub.

(h) FOR THESE MODELS: 4152, 4156A, 4158
With the parts heated, use the handles to rotate the fixture to disengage the airseal from the turbine hub.

(i) FOR THESE MODELS: 4152, 4156A, 4158
Loosen the jackscrews (506/5), bolts (506/2), and remove clamps (506/8). Loosen bolts (506/3) and slide clamps (506/9) outward from behind airseal upper knife−edge seal land. Use a hoist and suitable sling to remove the fixture from the airseal.

(21) FOR THESE MODELS: 4152, 4156A, 4158
Remove the 1st stage HPT airseal (506A/4) from the turbine front hub (506A/3) (Engines with SB PW4ENG 72−487). See Figure 506A.

(22) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the 1st stage HPT airseal (506A/4) from the turbine front hub (506A/3). See Figure 506A.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
The removal of the 1st stage HPT airseal will require the installation of a new brush seal assembly in 72−00−51, Installation−01 (Task 72−00−51−420−001) or 72−00−51, Installation−02 (Task 72−00−51−420−002) as applicable.

(a) Position PWA 87112 Fixture on a work bench. Remove the clamps (506A/6) from the fixture.

CAUTION: DO NOT DAMAGE KNIFE−EDGE SEALS OF THE AIRSEAL WHEN YOU INSTALL THE FIXTURE.

(b) Loosen the bolts (506A/2) that attach the ring (506A/5) to the plate (506A/1) and permit the ring to seat on the airseal. Make sure the ID of the plate (506A/1) is against the ID of the airseal.

(c) Attach the clamps (506A/6) to the ring and the outer flange of the airseal.

(d) Tighten the bolts (506A/2) to attach the ring (506A/5) to the fixture base.

CAUTION: MAKE SURE THAT THE TEMPERATURE PROBE IS IN CONTACT WITH THE TURBINE HUB OR THE HUB CAN BECOME TOO HOT.

(e) Heat the turbine hub equally to 300°F (148.9°C) maximum. Use Dry Ice P05−102 on the airseal to help to remove it from the turbine hub.

(f) With the turbine hub heated, apply light mallet pressure to the handles to turn the fixture and disengage the airseal from the turbine hub.

(g) Loosen the bolts (506A/2) and remove the clamps (506A/8). Use a hoist and sling to remove the fixture from the airseal.

(23) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the 1st stage HPT (inner) airseal and HPT flange spacer. See Figure 506B.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R Use the PWA 78176 Socket to remove the 24 bolts (506B/1) and the applicable number of counterweights (506B/2).

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the retaining ring of the PWA 87390 Jackscrew Puller and move the puller jaws out.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Lift the puller and put it on the turbine front hub (506B/6).

(d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the plate locator plate of the puller in the hub. Move the puller jaws in and adjust the jackscrew until the puller lip of the puller jaw is behind the OD of the airseal.

(e) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Turn the jackscrew and remove the airseal (506A/3) and the spacer (506B/5) from the hub.

(f) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Remove the airseal damper (506B/4) from the seal (506B/3). It is not permitted to use this damper again. Discard the damper.

(g) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Keep the airseal and the spacer in an applicable container to prevent damage.

(24) Install PWA 85087 Eye into the front ID of the turbine front hub (507/6). See Figure 507.

NOTE: See the following step to install the optional PWA 85083 Eye.

(a) Loosen the three locknuts (507/5) of PWA 85087 Eye. Turn the clamp assemblies (507/7) to align the pins so that they point toward the center of the lifting hub (507/4).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the lifting hub. Hold the clamps in position and tighten the three locknuts (507/5) to hold the eye on the turbine hub.

(25) Optional, install PWA 85083 Eye into the front ID of the turbine front hub. See Figure 507.

(a) Rotate the outer sleeve (507/10) and separate the outer sleeve from the inner ring (507/8).

(b) Position the inner ring onto the turbine front hub with three jaws (507/9) behind the step on the OD of the hub.

(c) Position the outer sleeve over the inner ring. Align the three dowel pins (507/12) in the inner ring with the mating slots in the outer sleeve.

(d) Rotate the outer sleeve to position the dowel pins in the bottom of the slots. Align the scribed alignment mark (507/11) on the outer sleeve with the scribed line on the dowel pin.

(26) Attach a hoist to PWA 85086 Arm. Remove the safety pin (507/3) and knurled nut (507/2) from the arm. Connect the arm to the lifting hole (507/1) of the PWA 85087 Eye or PWA 85083 and secure it with the knurled nut and safety pin.

(27) Use the hoist to remove the turbine hub from the heater and put it on a pallet. Remove the hoist, arm, and eye.

STAGE 1 TURBINE ROTOR ASSEMBLY - ASSEMBLY-01

Task 72-52-01-440-001:

1. Assemble 1st Stage Turbine Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-52-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the Special Tools list, and the optional flame torch.

Special Tools:

PWA 25672	Control, Heater (Optional to PWA 29754)
PWA 29754	Control, Heater
PWA 45548	Pin, Aligning
PWA 78176	Socket, Special (First Stage HPT Airseal Bolts, Post SB PW4ENG 72-504)
PWA 85081	Adapter, Moment Weight
PWA 85083	Eye, Handling (Optional to PWA 85087)
PWA 85085	Plate, Trunnion (Optional to PWA 86080)
PWA 85086	Arm, Lifting (Two Necessary)
PWA 85087	Eye, Lifting
PWA 85090	Fixture, Install (Engines without SB PW4ENG 72-487)
PWA 85091	Heater, Electrical
PWA 85289	Ring, Support
PWA 85561	Pin, Aligning (Two Necessary)
PWA 85634	Fixture, Support
PWA 86080	Eye, Lifting
PWA 86506	Wrench, Ratchet (Optional)
PWA 87112	Fixture, Install (Engines with SB PW4ENG 72-487 and all Phase III Engines)
PWA 87121	Ring, Adapter (Optional to PWA 85634)

Special Tools:

(CONTINUED)

	PWA 87751	Adapter, Torque
R	PWA 107120	Fixture, Lift (2nd Stage HPT Airseal)

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−026	Ink (PMC 4057−1)
P05−102	Ice, Dry
P05−395	Beeswax
P05−396	Paraffin Wax Blend
P08−010	Adhesive (EC−1300)
P08−022	Adhesive (EC−1357)

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac electric flameless heat gun, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE

FLAME WILL DAMAGE OR BURN NON−METAL PARTS. DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

(1) FOR THESE MODELS: 4152, 4156A, 4158
Position 1st stage HPT airseal (1001/2) on bench with smaller ID knife−edge side down. Position 1st stage HPT airseal damper (1001/1) into groove in ID of airseal. Apply Beeswax P05−395 or Paraffin Wax Blend P05−396 or Adhesive P08−010 or Adhesive P08−022 as necessary to keep the seal in position. See Figure 1001.

(2) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Position the 1st stage HPT (inner) airseal on a bench with the larger diameter side down. Assemble a new 1st stage HPT airseal damper into the groove in the OD of the airseal. Form the airseal damper (by gently bending) into the groove. The damper must go into the groove freely. While unconstrained, the damper must be spring-loaded outward in the groove with less than 0.020 inch (0.508 mm) above the groove side walls. Must be free to move circumferentially. See Figure 1001A.

(3) FOR THESE MODELS: 4152, 4156A, 4158
Position 1st stage HPT airseal (1002/3) on bench with knife-edge seal side down. Position seals (1002/1) and (1002/2) into inner grooves on rear face of airseal and cut as necessary to get a gap of 0.025 - 0.225 inch (0.6 - 5.7 mm) between ends of seals. Apply Beeswax P05-395 or Paraffin Wax Blend P05-396 or Adhesive P08-010 or Adhesive P08-022 as necessary to keep the seals in position. See Figure 1002.

(4) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Position 1st stage HPT airseal (1002A/3) on bench with knife-edge seal side down. Position seals (1002A/1) and (1002A/2) into inner grooves on rear face of airseal and cut as necessary to get a gap of 0.025 - 0.225 inch (0.6 - 5.7 mm) between ends of seals. Apply Beeswax P05-395 or Paraffin Wax Blend P05-396 or Adhesive P08-010 or Adhesive P08-022 as necessary to keep the seals in position. See Figure 1002A.

(5) Position 2nd stage HPT airseal (1003/3) on bench with larger ID end up. Position seals (1003/1) and (1003/2) into grooves in front outer face of airseal. Cut seals as required to obtain gaps of 0.025 - 0.225 inch (0.6 - 5.7 mm) between ends of seals. Apply Beeswax P05-395 or Paraffin Wax Blend P05-396 or Adhesive P08-010 or Adhesive P08-022 as necessary to keep the seals in position. See Figure 1003.

NOTE: SB PW4ENG 72-637 increased the fillet radius in the wire seal pocket of the 2nd stage HPT airseal (1003/3) to reduce stress concentrations at the front OD snap diameter. The normal centrifugal loads on the wire seal (1003/1) during engine operation will cause the seal to move out radially in the oversized pocket and will result in proper sealing. The wire seal does not require compression at assembly.

(6) Install PWA 85087 Eye into the front ID of the turbine front hub (1004/6). See Figure 1004.

NOTE: See the following step to install the optional PWA 85083 Eye.

(a) Loosen the three locknuts (1004/5) of PWA 85087 Eye. Turn the clamp assemblies (1004/7) to align the pins so that they point toward the center of the lifting hub (1004/4).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the lifting hub. Hold the clamps in position and tighten the three locknuts (1004/5) to hold the eye on the turbine hub.

(7) Optional, install PWA 85083 Eye into the front ID of the turbine front hub. See Figure 1004.

(a) Rotate the outer sleeve (1004/10) and separate the outer sleeve from the inner ring (1004/8).

(b) Position the inner ring onto the turbine front hub with three jaws (1004/9) behind the step on the OD of the hub.

(c) Position the outer sleeve over the inner ring. Align the three dowel pins (1004/12) in the inner ring with the mating slots in the outer sleeve.

(d) Rotate the outer sleeve to position the dowel pins in the bottom of the slots. Align the scribed alignment mark (1004/11) on the outer sleeve with the scribed line on the dowel pin.

(8) Attach a hoist to PWA 85086 Arm. Remove the safety pin (1004/3) and knurled nut (1004/2) from the arm. Connect the arm to the lifting hole (1004/1) of the PWA 85087 Eye or PWA 85083 Eye, and secure it with the knurled nut and safety pin.

(9) Use the hoist, to position the turbine front hub, splined end up, on a work bench. Remove hoist and arm.

(10) Determine part stacking requirements.

(a) Check the unbalance amount on the 1st stage HPT airseal (1002/3), turbine front hub (1005/4) and 2nd stage HPT airseal (1003/3).

NOTE: The unbalance amount is located adjacent to the unbalance symbol (triangle) on each part.

(b) If unbalance amounts are approximately equal, assemble parts with unbalance locations approximately 120 degrees apart.

(c) If the unbalance amounts are not approximately equal, position the unbalance locations of the turbine front hub, 1st stage HPT airseal, and 2nd stage HPT airseal 180 degrees apart, so that the combined unbalance of these parts is kept to a minimum.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
TURBINE FRONT HUB, WITH SHORTENED OUTER HUB TO AIRSEAL ENGAGEMENT LUGS, AND 1ST STAGE HPT AIRSEAL, WITH REDUCED AIRSEAL-TO-HUB OUTER LUG SNAP DIAMETER, (POST SB PW4ENG 72-314 OR PW4ENG 72-315) MUST BE USED IN SETS.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
TURBINE FRONT HUB PN 51L201 MUST BE USED IN ENGINES THAT INCORPORATE THE INTENT OF (SB PW4ENG 72-315).

(11) FOR THESE MODELS: 4152, 4156A, 4158
Install 1st stage HPT airseal on the turbine front hub (Engines without SB PW4ENG 72-487). See Figure 1005.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Place PWA 85091 Heater, heating element up, on the work bench.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Attach a hoist to PWA 85086 Arm. Remove the safety pin and the knurled nut from the arm. Connect the arm to the lifting hole of the eye, and secure it to the eye with the knurled nut and safety pin.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Use the hoist to put the turbine front hub, hub end up, on the heater. Remove the hoist, arm, and lifting eye.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
MAKE SURE THAT THE TEMPERATURE PROBE IS IN CONTACT WITH THE TURBINE HUB OR THE HUB CAN BECOME TOO HOT.

(d) FOR THESE MODELS: 4152, 4156A, 4158
Connect PWA 29754 Heater Control or PWA 25672 Heater Control to the heater.

(e) FOR THESE MODELS: 4152, 4156A, 4158
Position PWA 85090 Fixture on bench. Loosen and slide the clamp details (1005/9) outward. Retract jackscrews (1005/5). Remove clamps (1005/8) from the fixture.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Position the 1st stage HPT airseal (1005/6), knife−edge end up, over the turbine front hub. Rotate the airseal clockwise to engage the lugs of airseal with mating lugs on hub.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
DO NOT DAMAGE KNIFE−EDGE SEALS OF AIRSEAL WHEN INSTALLING FIXTURE.

(g) FOR THESE MODELS: 4152, 4156A, 4158
Loosen bolts (1005/2) securing ring (1005/7) to base plate and allow ring to seat on airseal.

(h) FOR THESE MODELS: 4152, 4156A, 4158
Slide clamp (1005/9) behind airseal upper knife−edge seal land and secure with bolts (1005/3).

(i) FOR THESE MODELS: 4152, 4156A, 4158
Attach clamps (1005/8) to the ring and outer flange of the airseal.

(j) FOR THESE MODELS: 4152, 4156A, 4158
Seat the jackscrews (1005/5). Tighten the jackscrews one half turn to apply a preload to the airseal.

(k) FOR THESE MODELS: 4152, 4156A, 4158
Tighten bolts (1005/2) to secure the ring to the fixture base.

(l) FOR THESE MODELS: 4152, 4156A, 4158
Heat the turbine hub to 300°F (148.9°C) maximum for assembly with a minimum temperature differential of 200°F (111°C).

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
Dry Ice P05-102 can be used on the airseal to help assemble the airseal.

(m) FOR THESE MODELS: 4152, 4156A, 4158
Apply a downward pressure on the fixture and rotate the fixture to position the lugs of the airseal directly under the lugs of the hub.

(n) FOR THESE MODELS: 4152, 4156A, 4158
Visually check to make sure that the blade antirotation lugs of the airseal do not come into the blade slots. See Figure 1006. If the antirotation lugs are not aligned, slightly rotate the fixture, then visually check for correct alignment.

1 FOR THESE MODELS: 4152, 4156A, 4158
Install a 1st stage HPT blade into a blade root slot of hub.

2 FOR THESE MODELS: 4152, 4156A, 4158
Blade root, ID section must be flush or below adjacent surface of hub as shown in referenced figure. Repeat the procedure at four equally spaced blade slot locations.

3 FOR THESE MODELS: 4152, 4156A, 4158
If blade root ID section is above adjacent surface of hub, airseal may be repositioned on hub before parts cool.

4 FOR THESE MODELS: 4152, 4156A, 4158
Recheck seating of airseal. Refer to the previous steps. If blade root ID section is still above adjacent surface of hub root, airseal must be removed and the wire seal and airseal must be installed again.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158 DO NOT DAMAGE KNIFE−EDGE SEALS OF AIRSEAL WHEN REMOVING FIXTURE.

(o) FOR THESE MODELS: 4152, 4156A, 4158
Loosen jackscrews (1005/5), bolts (1005/2), and remove clamps (1005/8). Loosen bolts (1005/3) and slide clamps (1005/9) outward from behind airseal upper knife−edge seal land. Using hoist and suitable sling remove fixture from airseal.

(12) FOR THESE MODELS: 4152, 4156A, 4158
Install the 1st stage HPT airseal on the turbine front hub (Engines with SB PW4ENG 72−487). See Figure 1005A.

(13) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the 1st stage HPT airseal on the turbine front hub. See Figure 1005A.

(a) Put PWA 85091 Heater, heating element up, on the work bench.

(b) Attach a hoist to PWA 85086 Arm. Remove the safety pin and the knurled nut from the arm. Connect the arm to the lifting hole of the eye, and attach it to the eye with the knurled nut and safety pin.

(c) Use the hoist to put the turbine front hub, hub end up, on the heater. Remove the hoist, arm, and lifting eye.

CAUTION: MAKE SURE THAT THE TEMPERATURE PROBE IS IN CONTACT WITH THE TURBINE HUB OR THE HUB CAN BECOME TOO HOT.

(d) Connect PWA 29754 Heater Control or PWA 25672 Heater Control to the heater.

(e) Put the PWA 87112 Fixture on the bench. Remove the clamps (1005A/6) from the fixture.

(f) Put the 1st stage HPT airseal (1005A/4), knife−edge end up, over the turbine front hub. Turn the airseal clockwise to engage the lugs of the airseal with the lugs on the hub.

CAUTION: DO NOT DAMAGE THE KNIFE-EDGE SEALS OF THE AIRSEAL WHEN YOU INSTALL THE FIXTURE.

(g) Loosen the bolts (1005A/2) which attach the ring (1005A/5) to the plate (1005A/1) and permit the ring to seat on the airseal. Make sure the ID of the plate (1005A/1) is against the ID of the airseal.

(h) Attach the clamps (1005A/6) to the ring and the outer flange of the airseal.

(i) Tighten the bolts (1005A/2) to attach the ring to the fixture base.

(j) Heat the turbine hub to 300°F (148.9°C) maximum for assembly with a minimum temperature differential of 200°F (111°C).

NOTE: Dry Ice P05-102 can be used on the airseal to help assemble the airseal.

(k) Apply a downward pressure on the fixture and turn the fixture to align the lugs of the airseal directly under the lugs of the hub.

(l) Visually check to make sure that the blade antirotation lugs of the airseal do not come into the blade slots. See Figure 1006. If the antirotation lugs are not aligned, slightly turn the fixture, then make a visual check for correct alignment.

(m) Check to make sure the 1st stage HPT airseal is seated on the hub with a turbine blade. See Figure 1007.

1 Install a 1st stage HPT blade into a blade root slot of the hub.

2 The blade root ID section must be even with or below the adjacent surface of the hub as shown in the referenced figure. Do this procedure at four equally spaced blade slot locations.

3 If the blade root ID section is above the adjacent surface of the hub, the airseal can be moved on the hub before the parts cool.

4 Check the seat of the airseal again. Refer to the steps used before. If the blade root ID section is still above the adjacent surface of the hub root, the airseal must be removed and the wire seal and airseal must be installed again.

CAUTION: DO NOT DAMAGE THE KNIFE−EDGE SEALS OF THE AIRSEAL WHEN YOU REMOVE THE FIXTURE.

(n) Loosen the bolts (1005A/2) and remove the clamps (1005A/6). Use a hoist and the applicable sling to remove the fixture from the airseal.

(o) Check seating of 1st stage HPT airseal on hub with a turbine blade. See Figure 1007.

(14) FOR THESE MODELS: 4152, 4156A, 4158
Install 1st stage HPT airseal (1008/2) on turbine front hub (1008/3). See Figure 1008.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove threaded pins (1008/8) from two PWA 85561 Alignment Pins. Position two blocks (1008/6) 180 degrees apart behind inner front flange of turbine front hub (1008/3). Position knurled nuts (1008/7) over blocks. Insert pins through front inner flange of hub and thread into nut and block. Tighten nut against rear side of flange to lock pin in position.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Align boltholes and position airseal over alignment pins and onto inner flange of turbine front hub.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Install 24 bolts through airseal and into hub. Install washers (1008/4) and nuts (1008/5), lubricated with Engine Oil P03−001. You can use the optional PWA 86506 Ratchet Wrench to install the nuts. Use PWA 87751 Torque Adapter to torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(15) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the 1st stage HPT (inner) airseal and spacer to the turbine front hub. See Figure 1008A.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
The installation of the 1st stage HPT airseal will require the installation of a new brush seal assembly in 72−00−51, Installation−01 (Task 72−00−51−420−001) or 72−00−51, Installation−02 (Task 72−00−51−420−002) as applicable.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Align the HPT flange spacer (1008A/3) and 1st stage HPT (inner) airseal (1008A/2) with each other and the bolt holes in the turbine front hub (1008A/4) with the use of the PWA 45548 Aligning Pin (1008A/5).

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Apply Engine Oil P03−001 to the threads of the 24 bolts (1008A/1). Install the bolts through the airseal, spacer and into the turbine front hub. Use a PWA 78176 Socket to torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
You install the counterweights when you static balance the 1st stage turbine rotor assembly in 72−52−01, Assembly−02 Task 72−52−01−440−002.

(16) Trunnion the front turbine hub to the front end down position. Use PWA 85087 Eye and PWA 86080 Eye. See Figure 1009.

NOTE: See the following step to trunnion the hub with optional PWA 85083 Eye and PWA 85085 Plate.

(a) Loosen the three locknuts (1009/5) of PWA 85087 Eye. Turn the clamp assemblies (1009/9) to align the pins so that they point toward the center of the lifting hub (1009/4).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the lifting hub (1009/4). Hold the clamps in position and tighten the three locknuts (1009/5) to hold the eye on the turbine hub.

(c) Attach a hoist to PWA 85086 Arm. Remove the safety pin (1009/3) and knurled nut (1009/2) from the arm. Connect the arm to the lifting hole (1009/1) of the PWA 85087 Eye, and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.

(d) Align the lifting hole of PWA 86080 Eye with the lifting hole of PWA 85087 Eye, and the posts (1009/6) with the mating holes in PWA 86080 Eye.

(e) Install the applicable (shorter) bolts (1009/7) to hold the PWA 86080 Eye.

(f) Attach a hoist to a second PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the PWA 86080 Eye and secure it with the knurled nut and safety pin.

(g) Trunnion the assembly to the front end down position.

(17) Optional, trunnion the front turbine hub to the front end down position. Use PWA 85083 Eye and PWA 85085 Plate. See Figure 1009.

(a) Rotate the outer sleeve (1009/12) and separate the outer sleeve from the inner ring (1009/10).

(b) Position the inner ring onto the turbine front hub with three jaws (1009/11) behind the step on the OD of the hub.

(c) Position the outer sleeve over the inner ring. Align the three dowel pins (1009/14) in the inner ring with the mating slots in the outer sleeve.

(d) Rotate the outer sleeve to position the dowel pins in the bottom of the slots. Align the scribed alignment marks (1009/13) on the outer sleeve with the scribed lines on the dowel pins.

(e) Attach a hoist to PWA 85086 Arm. Remove the safety pin and the knurled nut from the arm. Connect the arm to the lifting hole of the eye, and secure it to the eye with the knurled nut and safety pin. Use the hoist to lift the assembly.

(f) Position PWA 85085 Plate into the rear ID of the hub. Align the boltholes and thread two bolts (1009/15) into the detail nuts on the upper end of PWA 85083 Eye. Tighten the bolts to secure the plate.

(g) Attach a hoist to a second PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the lifting hole of the plate, and secure it with the knurled nut and safety pin.

(h) Trunnion the assembly to the front end down position.

(18) Position PWA 85634 Support Fixture on bench.

(19) Remove the lower hoist and PWA 85086 Arm. Lower the assembly into PWA 85634 Support. Remove the hoist, and arm.

(20) Position the seal (1010/1) into the outer groove in the rear face of 1st stage HPT airseal (1010/2) and cut as required to obtain a gap of 0.025 − 0.225 inch (0.6 − 5.7 mm) between ends of the seal. Apply Beeswax P05−395 or Paraffin Wax Blend P05−396 or Adhesive P08−010 or Adhesive P08−022 as necessary to keep the seal in position. See Figure 1010.

CAUTION: THE 1ST STAGE HPT BLADE ROOT ID SECTION MUST BE FLUSH OR BELOW THE ADJACENT SURFACE OF THE HUB OR DAMAGE TO THE BLADES CAN OCCUR.

(21) Check the location of the 1st stage HPT airseal on the hub.

(a) Install a 1st stage HPT blade into a blade root slot of the hub.

(b) The blade root, ID section must be flush or below adjacent surface of hub.

(c) If the blade root ID section is above the adjacent surface of the hub, the airseal must be removed and be installed again.

(d) Repeat steps (a) through (c) at four equally spaced blade slot locations.

(22) Center 60 1st stage HPT covers (1011/2) along the OD surface of hub adjacent to blade slots. Use a rawhide mallet to tap the lower plate detail of the covers as required to seat inboard edge of the covers between the turbine front hub (1011/1) and 1st stage HPT airseal (1011/3). See Figure 1011.

(23) Position PWA 85289 Support Ring on bench.

(24) Using hoist, position hub into support ring.

CAUTION: IT IS RECOMMENDED A FULL SET OF 60 NEW OR REFURBISHED 1ST STAGE BLADES ARE INSTALLED TO GET THE BEST PERFORMANCE, BUT IF THEY ARE NOT AVAILABLE, A MINIMUM OF 30 NEW OR REFURBISHED 1ST STAGE BLADES ARE NECESSARY TO GIVE ADEQUATE SEAL CUTTING. THE PREFERRED TIP COATING FOR THE 30 MINIMUM REPLACEMENT BLADES IS THE EXPOSED GRIT CBN (PWA 293-1). THE BLADES MUST BE INSTALLED DIAMETRICALLY OPPOSED FROM EACH OTHER. FAILURE TO DO SO WILL DECREASE ENGINE PERFORMANCE AND CAUSE MORE BLADE TIP WEAR.

CAUTION: AT LEAST SIX BLADES WITH ANTIROTATION TANGS THAT ARE NOT REPAIRED MUST BE INSTALLED IN THE 1ST STAGE TURBINE ROTOR ASSEMBLY TO MAKE SURE THAT YOU HAVE THE ANTIROTATION PROPERTIES OF THE BLADES.

CAUTION: FIRST STAGE HPT BLADES WITH THERMAL BARRIER COATING (TBC) (POST SB PW4ENG 72-466) CAN ONLY BE USED IN ENGINES WITH A TURBINE NOZZLE THAT INCORPORATES A STAGE 1 HPT (BLADE) COOLING DUCT ASSEMBLY (POST SB PW4ENG 72-466) THAT WILL SUPPLY INCREASED AIRFLOW OR DAMAGE TO THE BLADES CAN OCCUR.

(25) Obtain 60 1st stage HPT blades. If one or more new or repaired 1st stage duct segments are installed, a minimum of 30 blades must have acceptable abrasive tips. See the following step for the abrasive tip

acceptance standard. The balance of the blades can have tip rub into the base metal, or missing tip coating to the base metal to any extent, but the blade length must be within the limits of Figure 1012. See 72-52-07, Inspection/Check-03, PW4000 Series CIR, PN 51A357, (Task 72-52-07-200-003) for blade length measurement. See Table 1001 for blade interchangeability requirements.

Use the table as follows:

1. Select the engine model.
2. Find the letter code(s) that are applicable in the Engine Model Column.
3. Find the part numbers corresponding to the letter codes.
4. You can install any blade that has a letter code, and you can intermix blades with the same letter code in the specified Engine Models for that column.

EXAMPLE: For Engine Model PW4158, Letter Codes A, B, and C are found. Therefore blades with Letter Code C (PN 50L431-001 and PN 51L231) can be installed and can be intermixed.

NOTE: When one or more new duct segments are installed, and the intent of the shop visit is not to zero time the HPT module, the requirement of replacing a minimum of (30) blades may be waived by pretrenching the duct segments in accordance with the PW4000 Series CIR, PN 51A357, Chapter/Section 72-52-32, Repair-02.

First Stage HPT Blade Interchangeability
Table 1001

(CONTINUED)

	ENGINE MODELS			
PART NUMBER	PW4152 PW4156	PW4156A PW4158	PW4050 (-3) PW4152 (-3) PW4156 (-3) PW4156A (-3) PW4158 (-3)	REFERENCE SERVICE BULLETIN
50L531	A			PW4ENG 72-71
50L531-001	A			PW4ENG 72-469
50L531-002	A			PW4ENG 72-466
50L531-003	A			PW4ENG 72-466
50L731	A	A		PW4ENG 72-233
51L231	A	C		PW4ENG 72-466
51L831	B	B		PW4ENG 72-496
51L631			D	

FOR THESE MODELS: PW4156A, PW4158 - Parts Coded A can be installed but it is not recommended because of the higher operating temperatures. Blades with the same letter code can be intermixed in the same 1st stage turbine rotor. If there is no letter code in the engine models column, that blade part number can not be installed in the engine models specified for that column.

First Stage HPT Blade Interchangeability
Table 1001 (Continued)

(26) Blade abrasive tip visual acceptance standard. See Figure 1013.

NOTE: You do not have to count individual abrasive grits.

(a) One void area (absence of grits) 1/4 inch (6.350 mm) wide across the tip is permitted as shown in Figure 1012, provided it is not within 1/4 inch (6.350) of the airfoil leading or trailing edge. The general lay of the void area must not be parallel to the platform leading or trailing edge.

(b) Imperfections in the tip coating 1/16 inch (1.587 mm) diameter or less between the grits and separated by 1/32 inch (0.794 mm) or more are acceptable. Four imperfections of 1/16 inch (1.587 mm) diameter or less to the base metal interface are acceptable. Holes caused by grits falling out are not considered imperfections.

(27) Optional, document blade serial numbers. Blades manufactered after April, 1995 contain a Pratt & Whitney issued, 10−digit serial number under the blade platform. See Figure 1014.

NOTE: This serial number is traceable to the manufacture of the blade. Pratt & Whitney recommends that the serial numbers be recorded at assembly and be retained by the operator for tracking and traceability purposes.

(28) Moment weigh blades using suitable moment weight scale and PWA 85081 Adapter.

NOTE: Blades can be either mass weighed or moment weighed to determine the order of diminishing weight. See the following step for the optional mass weight method.

(a) Position PWA 85081 Adapter with adjustable thumbscrew facing up, on extension arm of moment weight scale. Secure in place using socket head cap screws.

(b) Loosen thumbscrew clamp. Position blade convex side up and insert blade root in locating jaws of adapter. Slide blade into jaws until root end contacts dowel pin stop. Tighten thumbscrew to secure blade.

(c) Determine moment weight of blade.

(d) Remove blade from adapter. Mark moment weight on concave side of airfoil using non−etching Ink P05−026.

(e) Weigh and mark remaining blades.

(29) Optional, mass weigh and mark the blades.

(30) Lay out 60 1st stage HPT blades in order of diminishing moment weight.

(31) Number blades from 1 to 60 in order of heaviest to lightest.

(32) Arrange blades in following order: 1, 3, 5, − 57, 59; 2, 4, 6, − 58, 60.

STAGE 1 TURBINE ROTOR ASSEMBLY - ASSEMBLY-01

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY FORCE REQUIRED TO INSTALL BLADES IN A HUB BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTIONS OF ALL BLADES CAN BE DAMAGED IF STRUCK.

(33) Install first blade in slot. See Figure 1015.

(34) Continue to install blades working in clockwise direction.

(35) Insert 1st stage HPT blade seal (1015/3), shorter end toward rear, into outer opening between blade roots. Use Beeswax P05-395 or Paraffin Wax Blend P05-396, as required to retain parts in position.

(36) Insert 1st stage HPT blade damper (1015/4), raised side up, through outer grooves between blade roots. Use a hoist and PWA 85086 Arm, to raise the assembly just enough to gently tap the blades to seat them in the hub. Lower the assembly down onto the support ring.

(37) Install 60 1st stage HPT airseals (1016/2) into outer portion of blade slot. See Figure 1016.

(38) Insert 60 1st stage HPT seals (1016/3) into opening between turbine hub and adjacent blades.

CAUTION: SECOND STAGE HPT AIRSEAL PN 50L195 CAN ONLY BE USED IN ENGINES THAT INCORPORATE THE INTENT OF (SB PW4ENG 72-315).

(39) Install 2nd stage HPT airseal (1017/1) onto turbine front hub (1017/2). See Figure 1017.

(a) Place PWA 85634 Fixture with large chamfered end up, on bench.

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Place the PWA 87121 Adapter Ring with open end up, on the bench.

(c) Using hoist, position turbine hub into support fixture.

(d) Heat the turbine hub airseal mating ID flange to 300°F (148.9°C) maximum for assembly with a minimum temperature differential of 200°F (111°C).

R R R NOTE: You can use Dry Ice P05-102 on the airseal front ID flange to help install the airseal as specified in the following step.

R R R (e) Optional, use the PWA 107120 Lift Fixture to put the front flange of the airseal on dry ice as follows: See Figure 1018.

R R 1 Move the two jaws of the fixture in the outboard position.

R R 2 Attach a hoist to the center lift eye of the fixture.

R R 3 Lower the fixture on the rear surface of the airseal.

R R R 4 Move the jaws to the inboard position and tighten the hand knobs to hold the jaws in position.

R R 5 Use the hoist to put the airseal, front end down on Dry Ice P05-102.

CAUTION: MAKE SURE THAT THE ANTI-ROTATION LUGS IN THE AIRSEAL ARE ALIGNED WITH THE ANTI-ROTATION SLOTS IN THE TURBINE HUB OR DAMAGE TO THE PARTS CAN OCCUR.

R (f) With the airseal at the correct temperature, put the airseal, larger OD end down, over the turbine front hub. Align the anti-rotation slots (1017/3) in the ID of airseal with the antirotation lugs (1017/4) on the inner flange of the hub. Seat the airseal on the hub.

E. Postrequisites

(1) Balance 1st stage turbine rotor assembly by one of the following methods:

(a) For horizontal balance method refer to Assemby-02 (Task 72-52-01-440-002).

(b) For vertical balance method refer to Assembly-03 (Task 72-52-01-440-003).

Task 72-52-01-440-002:

1. Static Balance Stage 1 Turbine Rotor Assembly

A. Prerequisites

(1) Assemble 1st stage turbine rotor assembly per Assembly-01 Task 72-52-01-440-001.

B. Equipment And Materials Necessary

Special Tools:

R R	PWA 78176	Socket, Special (First Stage HPT Airseal Bolts, Post SB PW4ENG 72-504)
	PWA 85084	Eye, Lifting
	PWA 85086	Arm, (Two Necessary)
	PWA 85095	Arbor, Balance
	PWA 85096	Stand, Assembly
	PWA 85097	Shroud
	PWA 85098	Weight, Calibration (Check Weight)
	PWA 85099	Stand, Storage
	PWA 86505	Wrench, Ratchet (Optional)
	PWA 86506	Wrench, Ratchet (Optional)
	PWA 87130	Weight, Calibration (Check Weight)
	PWA 87751	Adapter, Torque

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

C. Procedure

(1) Install the PWA 85095 Balance Arbor in the PWA 85096 Assembly Stand as follows:

(a) With a spanner wrench, tighten two lifting eyes on ends of arbor.

(b) Attach two PWA 85086 Arms to lifting eyes on arbor.

(c) Attach two hoists to arms and remove arbor from storage box.

(d) If necessary, remove the Detail-29 Check Weight from the shaft of the arbor.

(e) Trunnion arbor to front (drive) end down position. Remove lower lifting eye and arm.

(f) Remove bolts which attach the Detail-7 front (lower) retainer and remove retainer from arbor.

(g) Install the Detail-27 front safety ring over front (lower) expanding chuck and secure with three detail bolts.

(h) Remove quick release pin from PWA 85096 Stand. Lower arbor, front (drive) end down, into stand and secure with quick release pin. Remove lifting eye and arm.

(i) Using larger spanner wrench, remove nut (1001/1). Remove retainer (1001/2). See Figure 1001.

(j) If installed, remove nut (1001/3), spacer (1001/4) and ring.

(2) Install 1st stage turbine rotor assembly onto arbor.

(a) Install PWA 85084 Eye to rear of turbine rear hub.

1 Remove center bushing from eye.

2 Loosen three screws and slide locators radially inward.

3 Install eye into rear bore of hub.

4 Slide locators outward against ID of hub. Install center bushing into eye and tighten three screws to secure locators.

(b) Using hoist, connect standard three cable sling to lifting eyes of PWA 85084 Eye.

(c) Using hoist, install rotor onto arbor, aligning splines of hub with spline drives of arbor.

(d) Install spacer (1001/4) over rear (upper) expanding chuck and seat on shoulder of turbine hub.

(e) Make sure the safety ring (1001/7) is against shoulder of arbor.

STAGE 1 TURBINE ROTOR ASSEMBLY − ASSEMBLY−02

CAUTION: DO NOT OPERATE THE HYDRAULIC CHUCK DETAIL OF THE PWA 85095 ARBOR UNLESS THE THREE EXPANDING DIAMETERS ARE HELD BY THE ARBOR PARTS OR THE TURBINE HUB. IF YOU DO OPERATE THE CHUCK WITHOUT THESE PARTS, YOU CAN DAMAGE THE ARBOR.

(f) Use the wrench supplied with the arbor to tighten and loosen the hydraulic chuck actuating screw a number of times. Do this to put the rotor in the center. Tighten the actuating screw one last time to keep the rotor in position. Install the nut (1001/3).

(g) Install the rear retainer (1001/2) on the nut (1001/3) and attach it with the nut (1001/1).

(3) Install rear lifting eye to upper end of arbor. Install hoist with PWA 85086 Arm to lifting eye.

(4) Take up slack in hoist. Remove quick release pin from stand. Remove assembly from stand.

(5) Install front lifting eye to lower end of arbor. Install PWA 85086 Arm to lifting eye. Attach second hoist to lower arm.

(6) Using hoists, trunnion arbor and rotor assembly to horizontal position. Install assembly into cradles of PWA 85099 Stand. Remove hoists and arms.

NOTE: Front and rear sleeves of arbor should be covered with suitable protective material to avoid possible damage during transport and storage when in PWA 85099 Stand.

(7) Move the arbor and rotor assembly to the balance machine.

(8) Open cover of PWA 85097 Shroud. Using two hoists and arms, install arbor onto rollers of balance machine. Remove hoists, arms and lifting eyes from ends of arbor.

(9) Connect arbor to balance machine with direct drive (U−Joint driver, size 187/2) or install drive belt to sand blasted area on front end of arbor.

(10) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(11) Remove the arbor and the rotor assembly from the balance machine as follows:

(a) Open the cover of the PWA 85097 Shroud.

(b) If a direct drive is used, use an approved pen to make index marks on the direct drive and the arbor so that they will be reassembled in the same relative position.

(c) Install the detail lifting eyes to the ends of the arbor.

(d) Connect two hoists with two PWA 85086 Lifting Arms to the lifting eyes.

(e) With the hoists, install the arbor and rotor assembly in the PWA 85099 Stand. Remove the hoists.

NOTE: Cover the front and rear sleeves of the arbor with an applicable material. This will prevent possible damage during transport.

(f) Connect two hoists, lift the assembly from the stand and trunnion it to the front, hub end down, position. Remove the lower hoist and lifting arm.

(g) Remove the ball lock pin from the PWA 85096 Stand. Align the bolt holes and lower the arbor into the stand. Attach the arbor with the ball lock pin. See Figure 1001.

(h) Remove the upper hoist and lifting arm from the arbor.

(i) Use an approved pen to make index marks on the arbor, rear retainer, and spacer so that these details will be reassembled in the same relative position. Make index marks on the arbor and the turbine front hub.

(j) Use the spanner wrench to remove the retaining nut (1001/1) which attaches the retainer (1001/2).

(k) With the larger spanner wrench, remove the nut (1001/3). Also remove the spacer.

(l) Install the PWA 85084 Lifting Eye to the rear of the turbine rear hub as follows:

   1 Remove the center bushing from the eye.

   2 Loosen the three screws and move the locators radially inward.

   3 Install the lifting eye into the rear bore of the hub.

   4 Move the locators outward against the ID of the hub. Install the center bushing into the lifting eye and tighten the three screws to attach the locators.

(m) With the hoist, connect a standard three cable sling to the eyes of the PWA 85084 Lifting Eye.

(n) Lift the rotor assembly from the balance arbor. Index (turn) the rotor assembly 180 degrees and lower the assembly on the arbor while you align the hub's splines with the drive splines on the arbor.

(o) Remove the sling, hoist and the PWA 85084 Lifting Eye.

(p) Align the index marks and install the spacer (1001/4) on the arbor and against the shoulder of the turbine hub. Make sure the safety ring (1001/7) is against the shoulder of the arbor.

(q) Use the wrench supplied with the arbor to tighten and loosen the hydraulic chuck actuating screw a number of times. Do this to put the rotor in the center. Tighten the actuating screw one last time to keep the rotor in position.

(r) Install the nut (1001/3). Tighten the nut with the spanner wrench.

(s) Install the rear retainer (1001/2) on the nut (1001/3) and attach the retainer with the nut (1001/1). Tighten the nut with the spanner wrench.

(12) Install the rear lifting eye to the upper end of the arbor. Install the hoist with the PWA 85086 Lifting Arm to the lifting eye.

(13) Make sure the hoist has the correct tension. Remove the quick release pin from the stand. Remove the assembly from the stand.

(14) Install the front lifting eye to the lower end of the arbor. Install the PWA 85086 Lifting Arm to the lifting eye. Attach a second hoist to the lower lifting arm.

(15) With a hoist, trunnion the arbor and rotor assembly to the horizontal position. Install the assembly into the cradles of the PWA 85099 Stand. Remove the hoists and lifting arms.

NOTE: Cover the front and rear sleeves of the arbor with an applicable material. This will prevent possible damage during transport and storage while it is in the PWA 85099 Stand.

(16) Move the arbor and rotor assembly to the balance machine.

(17) Open the cover of the PWA 85097 Shroud. With the two hoists and lifting arms, install the arbor on the rollers of the balance machine. Remove the hoists, lifting arms and lifting eyes from the ends of the arbor.

(18) Connect the arbor to the balance machine with the direct drive and align the index marks on the arbor and the direct drive or install the drive belt to the sand blasted area on the front end of the arbor.

(19) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(20) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(21) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

(a) FOR THESE MODELS: 4152, 4156A, 4158
Install a maximum of ten counterweights over an arc of 180 degrees to correct any unbalance as follows: See Figure 1002.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158 (Pre SB PW4ENG 72−541) Use PN 50L088 counterweights. (Post SB PW4ENG 72−541) Use PN 50L924 counterweights.

1 FOR THESE MODELS: 4152, 4156A, 4158
Loosen and remove the bolt (1002/1), washer (1002/2), and nut (1002/3) at the counterweight locations with the optional PWA 86505 Ratchet Wrench.

2 FOR THESE MODELS: 4152, 4156A, 4158
Lubricate the threads of the bolts with Engine Oil P03-001.

3 FOR THESE MODELS: 4152, 4156A, 4158
Install the counterweights (1002/4) and attach in position with the bolts (1002/1) and nuts (1002/3) with the optional PWA 86506 Ratchet Wrench.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
Washers are not used under the nuts at the counterweight locations.

4 FOR THESE MODELS: 4152, 4156A, 4158
Torque the bolts with the PWA 87751 Adapter to 85 - 95 lb-in. (9.604 -10.734 N.m).

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
(Pre SB PW4ENG 72-541) Install a maximum of three counterweights over an arc of 180 degrees to correct any unbalance as follows: See Figure 1003.

1 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Loosen and remove the bolts (1003/1) that attach the air seal ring to the flange of the turbine hub at the angular location of unbalance.

2 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Lubricate the threads of the bolts (1003/1) with Engine Oil P03-001.

3 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the counterweights (1003/2) and attach in position with the bolts (1003/1).

4 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Use a PWA 78176 Socket to torque the bolts to 85 - 95 lb-in. (9.604 -10.734 N.m).

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
(Post SB PW4ENG 72-541) Install a maximum of ten counterweights over an arc of 180 degrees to correct any unbalance as follows: See Figure 1003.

1 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Loosen and remove the bolts (1003/1) that attach the air seal ring to the flange of the turbine hub at the angular location of unbalance.

2 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Lubricate the threads of the bolts (1003/1) with Engine Oil P03-001.

3 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the counterweights (1003/2) and attach in position with the bolts (1003/1).

4 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Use a PWA 78176 Socket to torque the bolts to 85 - 95 lb-in. (9.604 -10.734 N.m).

(d) Static balance the rotor assembly as described above until the residual unbalance is not more than 1.0 oz-in. (720.0 g.mm).

(e) Record the heavy angle and the amount of assembly unbalance.

(22) FOR THESE MODELS: 4152, 4156A, 4158
Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

(a) FOR THESE MODELS: 4152, 4156A, 4158
Loosen and remove a nut (1002/3) and washer (1002/2) or counterweight (1002/4) with the PWA 87751 Torque Adapter or the PWA 86505 Ratchet Wrench which attach the air seal ring to the flange of the turbine hub as close as possible to the angle of residual unbalance.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install the PWA 85098 Calibration Weight (Check Weight) at the location and attach with the removed washer (1002/2) or counterweight (1002/4) and nut (1002/3). Torque the nut to 85 - 95 lb-in. (9.604 -10.734 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
The check weight pulls 4.0 oz-in. (2880.0 g.mm).

(d) FOR THESE MODELS: 4152, 4156A, 4158
Do a check of the balance machine at 900 rpm minimum.

(e) FOR THESE MODELS: 4152, 4156A, 4158
The amount of unbalance should pull 4.0 oz−in. (2880.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in (288.0 g.mm).

(f) FOR THESE MODELS: 4152, 4156A, 4158
Remove the check weight.

(23) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Loosen and remove two adjacent bolts which attach the air seal ring to the flange of the turbine hub as close as possible to the angle of residual unbalance.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the PWA 87130 Calibration Weight (Check Weight) at the removed bolt locations and attach
R with the removed bolts. Use a PWA 78176 Socket to torque the bolts to 85 − 95 lb−in. (9.604 −10.734 N.m).

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
The check weight pulls 4.0 oz−in. (2880.0 g.mm).

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Do a check of the balance machine at 900 rpm minimum.

(e) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
The amount of unbalance should pull 4.0 oz−in. (2880.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in (288.0 g.mm).

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the check weight.

(24) Mark the unbalance symbol (triangle) and the amount of unbalance, adjacent to the unbalance symbol (triangle), on the rear side of the disk web at the location of heavy unbalance by SPOP 401 (Task 70-11-00-280-006), Standard Practices Manual, PN 585005. Use the shallow etch method.

NOTE: No burns, pitting or selective attack is permitted on the disk.

(25) Remove arbor and rotor assembly from balance machine and install in PWA 85099 Stand.

(a) Open cover of PWA 85097 Shroud.

(b) Install lifting eyes on ends of arbor.

(c) Connect two hoists with two PWA 85086 Arms to lifting eyes.

(d) Using hoists, install arbor and rotor assembly in PWA 85099 Stand. Remove hoists and arms.

NOTE: Front and rear sleeves of arbor should be covered with suitable protective material to avoid possible damage during transport in PWA 85099 Stand.

(26) Remove rotor assembly from arbor.

(a) Install two hoists with PWA 85086 Arms to lifting eyes on ends of arbor.

(b) Using hoists, lift assembly from stand and trunnion to front, hub, end down position. Remove lower hoist and trunnioning arm.

(c) Remove ball lock pin from stand. Align bolt holes and lower arbor into stand. Secure arbor with ball lock pin.

(d) Remove upper hoist and trunnioning arm from arbor.

(e) Remove retaining nut (1001/1) securing retainer (1001/2).

(f) Using larger spanner wrench, remove nut (1001/3). Remove spacer (1001/4).

(g) Install PWA 85084 Eye to rear of turbine rear hub.

1 Remove center bushing from eye.

2 Loosen three screws and slide locators radially inward.

3 Install eye into rear bore of hub.

4 Slide locators outward against ID of hub. Install center bushing into eye and tighten three screws to secure locators.

(h) Using hoist, connect standard three cable sling to lifting eyes of PWA 85084 Eye.

(i) Using hoist, install rotor assembly front end down in PWA 85634 Fixture. Remove PWA 85084 Eye.

(27) Remove arbor from stand.

(a) Install PWA 85086 Arm to upper lifting eye of arbor.

(b) Connect hoist to lifting eye. Take up slack in hoist.

(c) Remove ball lock pin from stand and remove arbor.

(d) Install lifting eye into lower end of arbor. Connect hoist and PWA 85086 Arm to lifting eye.

(e) Trunnion assembly to horizontal position and install arbor and details in storage box. Remove hoists and arms.

STAGE 1 TURBINE ROTOR ASSEMBLY - ASSEMBLY-03

Task 72-52-01-440-003:

1. Static Balance Stage 1 Turbine Rotor Assembly (Vertical Balance Method)

A. Prerequisites

(1) Assemble the 1st stage turbine rotor assembly. Refer to Assembly-01 Task 72-52-01-440-001.

B. Equipment And Materials Necessary

Special Tools:

R	PWA 78176	Socket, Special (First Stage HPT Airseal Bolts, Post SB PW4ENG 72-504)
	PWA 85084	Eye, Lifting
	PWA 85098	Weight, Calibration (Check Weight)
	PWA 86426	Arbor, Balance
	PWA 86505	Wrench, Ratchet (Optional)
	PWA 86506	Wrench, Ratchet (Optional)
	PWA 87130	Weight, Calibration (Check Weight)
	PWA 87751	Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

C. Procedure

(1) Install PWA 86426 Arbor onto the vertical balance machine.

(2) Install PWA 85084 Eye to rear of turbine hub.

(a) Remove the center bushing from the eye.

(b) Loosen three screws and the slide the locators radially inward.

(c) Install the eye into the rear bore of the hub.

(d) Slide the locators outward against the hub ID. Install the center bushing into the eye and tighten the three screws to secure the locators.

(3) Use a hoist to connect a standard three cable sling to the lifting eyes of PWA 85084 Eye. Use the hoist to install the rotor onto the arbor.

(4) Operate the balance machine.

  (a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

  (b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(5) Remove the rotor assembly from the balance machine as follows:

  (a) Remove the center bushing from the PWA 85084 Lifting Eye.

  (b) Loosen three screws and move the locators radially in.

  (c) Install the lifting eye into the rear bore of the hub.

  (d) Move the locators out against the hub ID. Install the center bushing into the lifting eye and tighten the three screws to attach the locators.

  (e) With the hoist, connect a standard three cable sling to the eyes of the PWA 85084 Lifting Eye.

  (f) Lift the rotor assembly from the balance arbor. Index (turn) the rotor assembly 180 degrees and lower the assembly on the arbor.

  (g) Remove the sling, hoist and the PWA 85084 Lifting Eye.

(6) Operate the balance machine.

  (a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(7) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(8) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

(a) FOR THESE MODELS: 4152, 4156A, 4158
Install a maximum of ten counterweights over an arc of 180 degrees to correct any unbalance as follows: See Figure 1001.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72−541) Use PN 50L088 counterweights. (Post SB PW4ENG 72−541) Use PN 50L924 counterweights.

1 FOR THESE MODELS: 4152, 4156A, 4158
Loosen and remove the bolt (1001/1), washer (1001/2), and nut (1001/3) at the counterweight locations with the optional PWA 86505 Ratchet Wrench.

2 FOR THESE MODELS: 4152, 4156A, 4158
Lubricate the threads of the bolts with Engine Oil P03−001.

3 FOR THESE MODELS: 4152, 4156A, 4158
Install the counterweights (1001/4) and attach in position with the bolts (1001/1) and nuts (1001/3) with the optional PWA 86506 Ratchet Wrench.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
Washers are not used under the nuts at the counterweight locations.

4 FOR THESE MODELS: 4152, 4156A, 4158
Torque the bolts with the PWA 87751 Adapter to 85 - 95 lb-in. (9.604 -10.734 N.m).

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
(Pre SB PW4ENG 72-541) Install a maximum of three counterweights over an arc of 180 degrees to correct any unbalance as follows: See Figure 1002.

1 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Loosen and remove the bolts (1002/1) that attach the air seal ring to the flange of the turbine hub at the angular location of unbalance.

2 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Lubricate the threads of the bolts (1002/1) with Engine Oil P03-001.

3 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the counterweights (1002/2) and attach in position with the bolts (1002/1).

4 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Use a PWA 78176 Socket to torque the bolts to 85 - 95 lb-in. (9.604 -10.734 N.m).

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
(Post SB PW4ENG 72-541) Install a maximum of ten counterweights over an arc of 180 degrees to correct any unbalance as follows: See Figure 1002.

1 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Loosen and remove the bolts (1002/1) that attach the air seal ring to the flange of the turbine hub at the angular location of unbalance.

2 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Lubricate the threads of the bolts (1002/1) with Engine Oil P03-001.

3 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the counterweights (1002/2) and attach in position with the bolts (1002/1).

4 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Use a PWA 78176 Socket to torque the bolts to 85 - 95 lb-in. (9.604 -10.734 N.m).

(9) FOR THESE MODELS: 4152, 4156A, 4158
Optional process based on the experience of the operator, do a check of the balance machine by Figure 1001 as follows:

(a) FOR THESE MODELS: 4152, 4156A, 4158
Loosen and remove a nut (1001/3) and washer (1001/2) or counterweight (1001/4) with the PWA 87751 Torque Adapter or the PWA 86505 Ratchet Wrench which attach the air seal ring to the flange of the turbine hub as close as possible to the angle of residual unbalance.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install the PWA 85098 Calibration Weight (Check Weight) at the location and attach with the removed washer (1001/2) or counterweight (1001/4) and nut (1001/3). Torque the nut to 85 - 95 lb-in. (9.604 -10.734 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
The check weight pulls 4.0 oz-in. (2880.0 g.mm).

(d) FOR THESE MODELS: 4152, 4156A, 4158
Do a check of the balance machine at 900 rpm minimum.

(e) FOR THESE MODELS: 4152, 4156A, 4158
The amount of unbalance should pull 4.0 oz-in. (2880.0 g.mm) plus the remaining residual unbalance ± 0.4 oz-in (288.0 g.mm).

(f) FOR THESE MODELS: 4152, 4156A, 4158
Remove the check weight.

STAGE 1 TURBINE ROTOR ASSEMBLY - ASSEMBLY-03

(10) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Loosen and remove two adjacent bolts which attach the air seal ring to the flange of the turbine hub as close as possible to the angle of residual unbalance.

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the PWA 87130 Calibration Weight (Check Weight) at the removed bolt locations and attach R with the removed bolts. Use a PWA 78176 Socket to torque the bolts to 85 - 95 lb-in. (9.604 -10.734 N.m).

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
The check weight pulls 4.0 oz-in. (2880.0 g.mm).

(d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Do a check of the balance machine at 900 rpm minimum.

(e) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
The amount of unbalance should pull 4.0 oz-in. (2880.0 g.mm) plus the remaining residual unbalance ± 0.4 oz-in (288.0 g.mm).

(f) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Remove the check weight.

(11) Mark the unbalance symbol (triangle) and the amount of unbalance, adjacent to the unbalance symbol (triangle), on the rear side of the disk web at the location of heavy unbalance by SPOP 401 (Task 70-11-00-280-006), Standard Practices Manual, PN 585005. Use the shallow etch method.

NOTE: No burns, pitting or selective attack is permitted on the disk.

(12) Remove the rotor assembly from the balance machine.

(a) Remove the center bushing from the PWA 85084 Lifting Eye.

(b) Loosen three screws and move the locators radially in.

(c) Install the lifting eye into the rear bore of the hub.

(d) Move the locators out against the hub ID. Install the center bushing into the lifting eye and tighten the three screws to attach the locators.

(e) With the hoist, connect a standard three cable sling to the eyes of the PWA 85084 Lifting Eye.

(f) Lift the rotor assembly from the balance arbor. Install the rotor assembly front end down, in the PWA 85634 Support Fixture.

(g) Remove the sling, hoist and the PWA 85084 Lifting Eye.

(13) Remove the arbor from the balance machine.

STAGE 2 TURBINE ROTOR ASSEMBLY - DISASSEMBLY-01

Task 72-52-02-040-001:

1. Disassemble 2nd Stage Turbine Rotor Assembly

A. Equipment And Materials Required

Special Tools:
PWA 25672 Control, Heater (Optional to PWA 29754)
PWA 29754 Control, Heater
PWA 85086 Arm (Two Necessary)
PWA 85087 Eye, Lifting
PWA 85088 Fixture, Support (Optional to PWA 88719)
PWA 85089 Eye, Handling (Optional to PWA 86080)
PWA 85100 Heater, Electrical
PWA 85101 Fixture, Removal
PWA 86080 Eye, Lifting
PWA 88719 Stand

Consumable Materials:

Item No.	Designation
P05-102	Ice, Dry

B. Procedure

(1) Install PWA 85087 Eye into the front end of the turbine intermediate hub (501/5). See Figure 501.

  (a) Loosen the three locknuts (501/6). Turn the clamp assemblies (501/7) to align the pins so that they point toward the center of the lifting hub (501/4).

  (b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point radially outward, toward the "LOCKED POSITION" marks on the hub (501/4). Hold the clamps in position and tighten the three locknuts (501/6) to hold the eye on the turbine hub.

(2) Attach a hoist to PWA 85086 Arm. Remove the safety pin (501/3) and knurled nut (501/2) from the arm. Connect the arm to the lifting hole (501/1) of the Eye (PWA 85087), and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.

(3) If applicable, position the rotor assembly onto PWA 85088 Support Fixture or PWA 88719 Stand.

  (a) Use the hoist to install the rotor assembly, front end up, onto the support fixture. Remove the hoist and arm.

(4) Remove 2nd stage HPT blade covers (502/1). See Figure 502.

(5) Position a suitable blade support over the blades to prevent them from dropping out during the following trunnioning procedure. Secure support to hub.

(6) Install PWA 86080 Eye and PWA 85086 Arms to trunnion the turbine intermediate hub to the front end down position. See Figure 503.

NOTE: See the following step to trunnion the turbine intermediate hub with optional PWA 85087 Eye (prior to Change A) and PWA 85089 Eye.

See the following step to install the optional Eye (PWA 85089).

- (a) Attach a hoist to Arm (PWA 85086). Remove the safety pin (503/3) and knurled nut (503/2) from the arm. Connect the arm to the lifting hole (503/1) of the Eye (PWA 85087), and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.
- (b) Align the lifting hole of Eye (PWA 86080) with the lifting hole of Eye (PWA 85087), and the posts (503/5) with the mating holes in Eye (PWA 86080).
- (c) Install the applicable (longer) bolts to hold the Eye (PWA 86080).
- (d) Attach a hoist to Arm (PWA 85086). Remove the safety pin and knurled nut from the arm. Connect the arm to the lifting hole of the Eye (PWA 85087), and secure it with the knurled nut and safety pin.

(7) Optional, install PWA 85089 Eye, and PWA 85086 Arms to trunnion the turbine intermediate hub to the front end down position. See Figure 503.

- (a) Attach a hoist to Arm (PWA 85086). Remove the safety pin (503/3) and knurled nut (503/2) from the arm. Connect the arm to the lifting hole (503/1) of the Eye (PWA 85087), and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.
- (b) Align the lifting hole of Eye (PWA 85089) with the lifting hole of Eye (PWA 85087), and the rods (503/13) with the mating holes in Eye (PWA 85087).
- (c) Attach a hoist to second Arm (PWA 85086). Remove the safety pin and knurled nut from the arm. Connect the arm to the Eye (PWA 85089) and secure it with the knurled nut and safety pin.

(8) Use both hoists to trunnion the rotor assembly to front end down position. Remove the lower arm attached to eye on front end of the hub. Lower the assembly over the work table.

STAGE 2 TURBINE ROTOR ASSEMBLY – DISASSEMBLY-01

(9) Carefully remove the blade support.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY FORCE REQUIRED TO REMOVE BLADES FROM HUB BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTIONS OF ALL BLADES CAN BE DAMAGED IF STRUCK.

(10) Remove 2nd stage HPT blades (504/2) dampers (504/4) and seals (504/3) from turbine intermediate hub (504/1). See Figure 504.
(11) Place PWA 85100 Heater, heating element up, on bench.
(12) Install hoist and Arm (PWA 85086) to eye on the turbine hub. Lift the assembly and lower it onto the Heater (PWA 85100).
(13) Bend 2nd stage HPC locks (505/2) and remove 2nd stage HPT keys (505/1) at four locations. Remove and discard locks. See Figure 505.
(14) Using suitable sling and hoist, position PWA 85101 Fixture over 2nd stage HPT blade retaining plate (506/3).
    (a) Loosen eight bolts (506/6) securing clamps on OD of lower ring.
    (b) Completely loosen 16 cap screws (506/2) securing lower ring (506/5) to ring (506/1).
    (c) Using detail handles, install outer ring details onto retaining plate (506/8). Rotate retaining rings counterclockwise until dowel pins (506/4) seat against lugs (506/3) on retaining plate.

    CAUTION: SIXTEEN CAP SCREWS SECURING UPPER AND LOWER RING DETAILS MUST BE LOOSE PRIOR TO SECURING CLAMPS OR DAMAGE TO RETAINING PLATE MAY RESULT.

    (d) Tighten eight bolts (506/6) to secure clamps (506/7) and retaining plate OD flange to (lower) ring (506/5).

STAGE 2 TURBINE ROTOR ASSEMBLY − DISASSEMBLY−01

CAUTION: DO NOT TIGHTEN CAP SCREWS (506/2) UNTIL EIGHT CLAMPS (506/7) HAVE BEEN SECURED OR DAMAGE TO RETAINING PLATE MAY RESULT.

(e) Tighten 16 cap screws (506/2) until bottom of (upper) ring (506/1) contacts top of (lower) ring (506/5).

NOTE: Tightening cap screws secures inner and outer rings and provides axial load on retaining plate to facilitate removal of retaining plate.

CAUTION: TEMPERATURE PROBE MUST CONTACT HUB OR OVERHEATING OF PARTS MAY RESULT.

(15) Connect heater to PWA 29754 or PWA 25672 Heater Control to heater. Position probe insuring that it is in contact with hub. Put the cover detail of the heater over the hub.

(16) Heat the hub to approximately 300°F (148.9°C). Pour crushed Dry Ice (P05−102) through the openings between the fixture and the retaining plate as you heat the retaining plate. Add more dry ice as necessary until the hub is heated.

(17) Remove the cover detail of the heater. Tap the lugs on the fixture with a hammer to disengage the lugs on the plate from the lugs on the hub. Remove the fixture. Remove the retaining plate from the hub.

(18) Connect a hoist with Arm (PWA 85086) to Eye (PWA 86080) or (PWA 85089) on the rear of the hub.

(19) Lift the hub and attach a second hoist and Arm (PWA 85086) to eye on front end of hub.

(20) Trunnion assembly to rear end down position and remove the lower hoist, arm and Eye from the rear end of the hub. Lower the hub onto a pallet. Remove the hoist, and arm from the hub.

(21) Loosen locknuts that secure the clamps to turbine hub. Turn the clamps to disengage the hub and remove the Eye (PWA 85087) from the hub.

Previous Pageblock   Return to Previous Menu   Next Pageblock

STAGE 2 TURBINE ROTOR ASSEMBLY - ASSEMBLY-01

Task 72-52-02-440-001:

1. Assemble 2nd Stage Turbine Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-52-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the Special Tools list, and the optional flame torch.

Special Tools:

PWA 25672	Control, Heater (Optional to PWA 29754)
PWA 29754	Control, Heater
PWA 85082	Adapter, Moment Weight
PWA 85086	Arm (Two Required)
PWA 85087	Eye, Lifting
PWA 85088	Fixture, Support (Optional to PWA 88719)
PWA 85089	Eye, Handling (Optional to PWA 86080)
PWA 85100	Heater, Electrical
PWA 85101	Fixture, Install
PWA 85288	Ring, Support
PWA 85702	Bender, Manual
PWA 86080	Eye, Lifting
PWA 88719	Stand

Consumable Materials:

Item No.	Designation
P05−026	Ink (PMC 4057−1)
P05−102	Ice, Dry
P05−395	Beeswax
P05−396	Paraffin Wax Blend
P08−010	Adhesive (EC−1300)
P08−022	Adhesive (EC−1357)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock, 2nd Stage HPT	4	72−52−00/6/120
Seal	1	72−52−00/6/90

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Electric Flameless Heat Gun, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE

FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

(1) Examine the turbine intermediate hub for the correct installed quantity of stage 2 HPT metering plugs that are installed in the correct part number hub. See PW4152 Series IPC, PN 50A445 for part number applicabilities.

(2) Install seal into 2nd stage HPT blade retaining plate. See Figure 1001.

STAGE 2 TURBINE ROTOR ASSEMBLY − ASSEMBLY−01

(a) Position 2nd stage HPT blade retaining plate (1001/2), smaller OD side down, on bench.

(b) Position seal (1001/1) into seal groove (1001/3) in front face of plate. Cut seal to obtain gap of 0.025 − 0.225 inch (0.6 − 5.7 mm) between ends of seal.

(c) Secure seal in groove with Beeswax P05−395 or Paraffin Wax Blend P05−396 or Adhesive P08−010 or Adhesive P08−022 as necessary.

(3) Place PWA 85100 Heater, heating element up, on bench.

(4) Install PWA 85087 Eye and PWA 86080 Eye, and PWA 85086 Arms to trunnion the turbine intermediate hub to the front end down position. See Figure 1002.

NOTE: See the following step to trunnion the turbine intermediate hub with optional PWA 85087 Eye and PWA 85089 Eye.

(a) Loosen the three locknuts (1002/8) of PWA 85087 Eye. Turn the clamp assemblies (1002/9) to align the pins so that they point toward the center of the lifting hub (1002/4).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the lifting hub (1002/4). Hold the clamps in position and tighten the three locknuts (1002/8) to hold the eye on the turbine hub.

(c) Attach a hoist to PWA 85086 Arm. Remove the safety pin (1002/3) and knurled nut (1002/2) from the arm. Connect the arm to the lifting hole (1002/1) of the PWA 85087 Eye, and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.

(d) Align the lifting hole of PWA 86080 Eye with the lifting hole of PWA 85087 Eye, and the posts (1002/5) with the mating holes in PWA 86080 Eye.

(e) Install the applicable (longer) bolts to hold the PWA 86080 Eye.

(f) Attach a hoist to second PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the PWA 86080 Eye and secure it with the knurled nut and safety pin.

(5) Optional, install PWA 85087 Eye and PWA 85089 Eye, and PWA 85086 Arms to trunnion the turbine intermediate hub to the front end down position. See Figure 1002.

(a) Loosen the three locknuts (1002/10) of PWA 85087 Eye. Turn the clamp assemblies (1002/11) to align the pins so that they point toward the center of the lifting hub (1002/12).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that the pins point outward. Hold the clamps in position and tighten the three locknuts (1002/10) to hold the eye on the turbine hub.

(c) Attach a hoist to PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the lifting hole of the PWA 85087 Eye, and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.

(d) Insert the PWA 85089 Eye into the rear bore of the turbine hub. Align the lifting hole of PWA 85089 Eye with the lifting hole of PWA 85087 Eye, and the rods (1002/13) with the mating holes in PWA 85089 Eye. Thread three rods (1002/13) into PWA 85087 Eye to secure the eyes.

(e) Attach a hoist to second PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the PWA 85089 Eye and secure it with the knurled nut and safety pin.

(6) Use both hoists to trunnion the assembly to front, hub end down, position. Remove the lower hoist, and arm.

(7) Lower the hub, splined end down, into the heater. Remove the hoist and arm.

(8) Remove the PWA 86080 Eye or PWA 85089 Eye from the turbine hub.

STAGE 2 TURBINE ROTOR ASSEMBLY − ASSEMBLY−01

(9) Locate unbalance symbol (triangle) marked on rear side of hub between blade root slots. Transfer unbalance symbol onto center 1/3 of hub using Ink P05−026.

(10) Install 2nd stage HPT blade retaining plate (1003/8) onto turbine intermediate hub using PWA 85101 Fixture. See Figure 1003.

(a) If required, transfer unbalance mark to outer flange area of retaining plate using Ink P05−026.

(b) Position retaining plate, larger OD side down, on bench.

(c) Loosen eight bolts (1003/6) securing clamps (1003/7) on OD of lower ring.

(d) Completely loosen 16 cap screws (1003/2) securing lower ring (1003/5) to ring (1003/1).

(e) Using detail handles, install outer ring details onto retaining plate (1003/8). Rotate retaining rings counterclockwise until dowel pins (1003/4) seat against lugs (1003/3) on retaining plate.

CAUTION: SIXTEEN CAP SCREWS SECURING UPPER AND LOWER RING DETAILS MUST BE LOOSE PRIOR TO SECURING CLAMPS OR DAMAGE TO RETAINING PLATE MAY RESULT.

(f) Tighten eight bolts (1003/6) to secure clamps (1003/7) and retaining plate OD flange to (lower) ring (1003/5).

CAUTION: DO NOT TIGHTEN CAP SCREWS (1003/2) UNTIL EIGHT CLAMPS (1003/7) HAVE BEEN SECURED OR DAMAGE TO RETAINING PLATE MAY RESULT.

(g) Tighten 16 cap screws (1003/2) until bottom of (upper) ring (1003/1) contacts top of (lower) ring (1003/5).

NOTE: Tightening cap screws secures inner and outer rings and provides axial load on retaining plate to facilitate installation of retaining plate.

CAUTION: TEMPERATURE PROBE MUST CONTACT HUB OR OVERHEATING OF PARTS MAY RESULT.

(h) Connect PWA 25672 Heater Control or PWA 29754 Heater Control to heater. Position probe to contact hub. Put the cover detail of the heater over the hub. Heat hub to 300°F (148.9°C) maximum for assembly with minimum temperature differential of 200°F (111°C).

NOTE: Dry Ice P05−102 can be used on retaining plate to reduce interference fit.

(i) Remove the cover detail of the heater from the hub. Using handles, position fixture outer ring and retaining plate assembly over turbine intermediate hub (1004/5). Position unbalance mark on retaining plate 180 degrees from unbalance symbol on hub. Lower retaining plate, aligning lugs on retaining plate with mating slots in hub. See Figure 1004.

(j) Using handles, rotate outer ring clockwise until lugs (1004/3) on retaining plate are under mating lugs (1004/1) on hub. Rotate ring until dowel pin details (1004/2) are stopped against lugs on hub.

(k) Completely loosen 16 cap screws securing upper ring (1004/6) to lower ring (1004/4).

(l) Loosen eight bolts securing clamps to lower ring. Using handles, remove ring details from retaining plate.

(11) Install 2nd stage HPC locks and keys. See Figure 1005.

(a) Position four equally spaced 2nd stage HPT locks (1005/2), wider tabs first into openings between lugs of turbine intermediate hub (1005/4) and 2nd stage HPT blade retaining plate (1005/3).

(b) Position four 2nd stage HPT keys (1005/1) into grooves at lock locations. Install keys, smaller key detail first, into groove, with arrows on key pointing radially outward.

(c) Check position of locks per Figure 1006. Mating surfaces of Key N and Plate C must be flush within 0.010 inch (0.251 mm) to insure proper assembly.

(d) Firmly grip 2nd stage HPT lock using PWA 85702 Bender with curved jaw of bender toward ID of turbine hub. See Figure 1005 (Sheet 2). While pulling upward, bend lock around radius of key as far as possible without repositioning bender.

(e) Reposition bender with curved jaw toward OD of hub. See Figure 1005 (Sheet 2). Bend lock around key as far as possible without repositioning bender. Remove the bender.

(f) Using suitable aluminum drift, continue bending lock starting at radius of key and working outward along lock toward OD of hub.

(g) Inner surface of lock must be flush to 0.010 inch (0.254 mm) in relation to rear surface of key. A visual gap is produced at Location S (both sides). If no gap exists after bending lock, parts must be disassembled and new lock installed.

(12) Install PWA 86080 Eye into the rear bore of the turbine intermediate hub.

NOTE: See the following step to install the optional PWA 85089 Eye.

(a) Align the lifting hole of PWA 86080 Eye with the lifting hole of PWA 85087 Eye, and the posts with the mating holes in PWA 86080 Eye.

(b) Install the applicable (longer) bolts to hold the PWA 86080 Eye.

(c) Attach a hoist to PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the PWA 86080 Eye and secure it with the knurled nut and safety pin.

(13) Optional, install PWA 85089 Eye into the rear bore of the turbine intermediate hub.

(a) Align the lifting hole of PWA 85089 Eye with the lifting hole of PWA 85087 Eye, and the rods with the mating holes in PWA 85087 Eye. Thread three rods into PWA 85087 to secure the eyes.

(b) Attach a hoist to PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the PWA 85089 Eye and secure it with the knurled nut and safety pin.

(14) Lift the assembly and connect a hoist and second PWA 85086 Arm to the PWA 85087 Eye on the front of the hub. Trunnion the assembly to the front, hub, end up position.

(15) Remove the hoist, the lower PWA 85086 Arm, and the lower eye. Put PWA 85288 Support Ring with the smaller ID side down, on a suitable workbench. Lower the hub onto the ring. Remove the hoist and PWA 85086 Arm from the PWA 85087 Eye.

CAUTION: IT IS RECOMMENDED THAT A FULL SET OF 82 NEW OR REFURBISHED 2nd STAGE BLADES ARE INSTALLED TO GET THE BEST PERFORMANCE, BUT IF THEY ARE NOT AVAILABLE, A MINIMUM OF 30 2nd STAGE BLADES ARE NECESSARY TO GIVE ADEQUATE SEAL CUTTING. THE PREFERRED TIP COATING FOR THE 30 MINIMUM REPLACEMENT BLADES IS EXPOSED GRIT CBN, (PWA 293−1). THE REPLACEMENT BLADES MUST BE DIAMETERICALLY OPPOSED FROM EACH OTHER. FAILURE TO DO SO WILL CAUSE MORE TIP WEAR AND WILL DECREASE ENGINE PERFORMANCE.

(16) Obtain 82 2nd stage HPT blades. If one or more new 2nd stage duct segments are installed, a minimum of 30 blades must have acceptable abrasive tips. See the following step for the abrasive tip acceptance standard. The balance of the blades can have missing tip coating to the base metal to any extent, but can not have wear into the base metal. See Table 1001 for blade interchangeability requirements.

NOTE: When one or more new duct segments are installed, and the intent of the shop visit is not to zero time the HPT module, the requirement of replacing a minimum of (30) blades may be waived by pretrenching the duct segments in accordance with the PW4000 Series CIR, PN 51A357, Chapter/Section 72−52−32, Repair−02.

(17) Blade abrasive tip visual acceptance standard. See Figure 1007.

NOTE: You do not have to count individual abrasive grits.

(a) One void area (absence of grits) 1/4 inch (6.350 mm) wide across the tip is permitted as shown in Figure 1007, provided it is not within 1/4 inch (6.350) of the airfoil leading or trailing edge. The general lay of the void area must not be parallel to the platform leading or trailing edge.

(b) Imperfections in the tip coating 1/16 inch (1.587 mm) diameter or less between the grits and separated by 1/32 inch (0.794 mm) or more are acceptable. Four imperfections of 1/16 inch (1.587 mm) diameter or less to the base metal interface are acceptable. Holes caused by grits falling out are not considered imperfections.

(CONTINUED)

intermixed in the same 2nd stage turbine rotor. If there is no letter code in the engine models column, that blade part number cannot be installed in the engine models specified for that column.

Use the table as follows:

1. Select the engine model.
2. Find the letter code(s) that are applicable in the Engine Model Column.
3. Find the part numbers corresponding to the letter codes.
4. You can install any blade that has a letter code, and you can intermix blades with the same letter code in the specified Engine Models for that column.
5. You can intermix blades with letter codes 'A' and 'C' in applicable engine models.
6. You can intermix blades with letter codes 'B' and 'C' in applicable engine models.
7. You can intermix blades with letter codes 'C' and 'D' in applicable engine models.

Second Stage HPT Blade Interchangeability
Table 1001 (Continued)

(18) Optional, document blade serial numbers. Blades manufactured after April, 1995 contain a Pratt & Whitney issued, 10−digit serial number under the blade platform. See Figure 1008.

NOTE: This serial number is traceable to the manufacture of the blade. Pratt & Whitney recommends that the serial numbers be recorded at assembly and be retained by the operator for tracking and traceability purposes.

(19) Moment weigh 2nd stage HPT blades.

NOTE: Blades can be either mass weighed or moment weighed to determine order of diminishing weight. See the following step for the optional mass weight method.

(a) Install PWA 85082 Adapter, with thumb screw facing up, onto extension arm of moment weight scale.

NOTE: The extension arm positions Z−plane of blade root at 12.790 inches (324.866 mm) from centerline of scale. Extension arm may be locally fabricated or supplied by manufacturer of scale.

(b) Loosen thumbscrew clamp. Position blade, concave side up, and insert root end of blade into locating jaws of adapter. Slide blade into adapter until leading edge of blade root contacts end stop on upper locating jaw. Tighten clamp to secure blade.

(c) Moment weigh blade. Mark moment weight of blade on concave side of airfoil using Ink P05−026.

R CAUTION: BEFORE YOU INSTALL THE BLADES TO THE ROTOR,
R DO A VISUAL INSPECTION OF THE BLADE ROOT
R COVER FOR PROPER ORIENTATION. REFER TO THE
R CIR PN 51A357, 72−52−08, INSPECTION/CHECK−03,
R CONFIG−1, CONFIG−2, AND CONFIG−3 AS
R APPLICABLE.

(20) Optional, mass weigh and mark the blades.

(21) Lay out 82 2nd stage HPT blades in order of diminishing moment weight.

(22) Number blades from 1 to 82 in order of heaviest to lightest.

(23) Arrange blades as follows: 1, 3, 5, − 79, 81; 2, 4, 6, − 80, 82.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY FORCE REQUIRED TO INSTALL BLADES IN A HUB BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTIONS OF ALL BLADES CAN BE DAMAGED IF STRUCK.

(24) Install first blade in slot of hub and onto PWA 85288 Ring.

(25) Continue to install blades working in counterclockwise direction.

(26) Install 2nd stage HPT blade seals (1009/4) into small outer cavity formed between adjacent blades. Use Beeswax P05-395 or Paraffin Wax Blend P05-396, as required to retain parts in position. See Figure 1009.

(27) Install 2nd stage HPT blade dampers (1009/3) into outer end of larger cavity formed between adjacent blades. Use Beeswax P05-395 or Paraffin Wax Blend P05-396 as required to retain parts in position.

(28) Connect a hoist and PWA 85086 Arm to the PWA 85087 Eye. Raise the assembly and remove the PWA 85288 Ring. Lower the hub onto PWA 85088 Fixture or PWA 88719 Stand. Remove the hoist, arm, and eye.

(29) Seat blades into hub.

(30) Install 2nd stage HPT blade covers, Class 1, (1009/1) into inner cavity between adjacent blades.

E. Postrequisites

(1) Balance 2nd stage turbine rotor assembly by one of the following methods.

(a) For horizontal balance method refer to Assembly-02 (Task 72-52-02-440-002).

(b) For vertical balance method refer to Assembly-03 (Task 72-52-02-440-003).

Task 72-52-02-440-002:

1. Static Balance Stage 2 Turbine Rotor Assembly

A. Prerequisites

(1) Assemble 2nd stage turbine rotor assembly per Assembly-01 Task 72-52-02-440-001.

B. Equipment And Materials Necessary

Standard Tools

Scale, Mass Weight

Special Tools:

PWA 85086	Arm (Two Necessary)
PWA 85095	Arbor, Balance
PWA 85097	Shroud
PWA 85099	Stand, Storage
PWA 86535	Fixture, Lift
PWA 88719	Stand, Support

Consumable Materials:

Item No.	Designation
P05-395	Beeswax
P05-396	Paraffin Wax Blend

C. Procedure

(1) If necessary, install the 2nd stage turbine rotor, rear end down on the PWA 88719 Support Stand as follows:

(a) Install the PWA 86535 Lift Fixture in the front bore of the hub.

(b) Lift the lock pin and engage the fixture on the hub and lock the fixture to the hub by moving the lock pin down below the shown "Locked" line. R

(c) With a hoist, install the rotor on the PWA 88719 Support Stand.

(2) Remove the PWA 85095 Arbor from the storage box as follows:

STAGE 2 TURBINE ROTOR ASSEMBLY − ASSEMBLY−02

(a) With a spanner wrench, tighten the two lifting eyes on the ends of the arbor.

(b) Attach two PWA 85086 Lifting Arms to the lifting eyes on the arbor.

(c) Attach two hoists to the lifting arms and remove the arbor from its storage box.

(d) If necessary, remove the Detail−29 Check Weight from the shaft of the arbor.

(3) If necessary, remove the Detail−7 front retainer from the arbor as follows:

(a) Trunnion arbor to the front (drive) end down position. Remove the lower hoist.

(b) Remove the bolts which attach the Detail−7 front (lower) retainer and remove it from the arbor.

(c) Attach a hoist to the lower lifting arm and trunnion the arbor to the rear end down (drive end up) position. Remove the lower hoist and lifting arm.

(4) Install PWA 85095 Arbor into turbine rear hub. See Figure 1001.

(a) Remove the Detail−25 nut, the Detail−36 rear retainer, the Detail−35 nut and the Detail−23 rear spacer from the arbor.

(b) Install the Detail−9 front spacer on the arbor over the actuating chuck. Temporarily attach the spacer in position with standard 3.0 inch (76.200 mm) C−clamps.

(c) Lower arbor into turbine intermediate hub (1001/4) aligning splines in hub with two spline drives on arbor.

(d) Remove the hoist and lifting arm.

(e) Remove C−clamps which attach the spacer (1001/3).

(f) Install the Detail−7 front retainer (1001/2) and attach it with three bolts (1001/1). Tighten the bolts.

CAUTION: DO NOT OPERATE THE HYDRAULIC CHUCK DETAIL OF THE PWA 85095 ARBOR UNLESS THE THREE EXPANDING DIAMETERS ARE HELD BY THE ARBOR PARTS OR THE TURBINE HUB. IF YOU DO OPERATE THE CHUCK WITHOUT THESE PARTS, YOU CAN DAMAGE THE ARBOR.

(g) Use the wrench supplied with the arbor to tighten and loosen the hydraulic chuck actuating screw a number of times. Do this to put the rotor in the center. Tighten the actuating screw one last time to keep the rotor in position.

(h) Put the Detail−10 nut on the end of the arbor and against the shoulder in the ID of the hub. Tighten the nut with the larger spanner wrench.

(5) Connect PWA 85086 Arm to upper lifting eye of arbor. Attach hoist to arm and lift assembly from stand.

(6) Install lifting eye to lower end of arbor. Connect second PWA 85086 Arm and hoist to lifting eye.

(7) Using hoists, trunnion arbor and rotor assembly to horizontal position. Install assembly into PWA 85099 Stand. Remove hoists and arms.

NOTE: Front and rear sleeves of arbor should be covered with suitable protective material to avoid possible damage during transport and storage when in PWA 85099 Stand.

(8) Move the arbor and rotor assembly to the balance machine.

(9) Open cover of PWA 85097 Shroud. Connect two hoists, with PWA 85086 Arms to lifting eyes on ends of arbor. Using hoists, remove assembly from stand and install arbor onto rollers of balance machine.

(10) Remove hoists, arms, and lifting eyes from ends of arbor.

(11) Connect arbor to balance machine with direct drive (U−Joint driver size 187/2) or install drive belt to sand blasted area on front end of arbor.

(12) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(13) Remove the arbor and the rotor assembly from the balance machine as follows:

(a) Open the cover of the PWA 85097 Shroud.

(b) If a direct drive is used, use an approved pen to make index marks on the direct drive and the arbor so that they will be reassembled in the same relative position.

(c) Install the detail lifting eyes to the ends of the arbor.

(d) Connect two hoists with two PWA 85086 Lifting Arms to the lifting eyes.

(e) With the hoists, install the arbor and rotor assembly in the PWA 85099 Storage Stand. Remove the hoists.

NOTE: Cover the front and rear sleeves of the arbor with an applicable material. This will prevent possible damage during transport.

(f) Move the assembly to the support stand.

(g) Connect two hoists to the lifting arms, lift the assembly from the stand and trunnion the arbor to the rear end down (drive end up) position. Remove the lower lifting arm and hoist.

(h) Lower the arbor and the rotor assembly to the PWA 88719 Support Stand.

(i) Remove the upper hoist and lifting arm from the arbor.

(j) Use an approved pen to make index marks on the arbor and front retainer so that these details will be reassembled in the same relative position. Make index marks on the arbor and the turbine rear hub.

(k) Loosen and remove the three bolts that attach the Detail−7 front retainer. Remove the front retainer.

(l) Temporarily attach the Detail−9 front spacer in position with standard 3.0 inch (76.200 mm) C−clamps.

(m) Loosen and remove the Detail−10 nut from the end of the arbor.

(n) Loosen the hydraulic actuating screw to permit the removal of the arbor. Use the wrench supplied with the arbor to do this.

(o) Install the PWA 85086 Lifting Arm to the upper lifting eye on the arbor.

(p) With a hoist lift the balance arbor from the rotor assembly. Index (turn) the balance arbor 180 degrees and lower the arbor in the rotor assembly while you align the hub's splines with the drive splines on the arbor.

(q) Remove the hoist and lifting arm from the arbor.

(r) Remove the C−clamps which attach the spacer.

(s) Align the index marks and install the Detail−7 front retainer and attach it with three bolts. Tighten the bolts.

CAUTION: DO NOT OPERATE THE HYDRAULIC CHUCK DETAIL OF THE PWA 85095 ARBOR UNLESS THE THREE EXPANDING DIAMETERS ARE HELD BY THE ARBOR PARTS OR THE TURBINE HUB. IF YOU DO OPERATE THE CHUCK WITHOUT THESE PARTS, YOU CAN DAMAGE THE ARBOR.

(t) Use the wrench supplied with the arbor to tighten and loosen the hydraulic chuck actuating screw a number of times. Do this to put the rotor in the center. Tighten the actuating screw one last time to keep the rotor in position.

(u) Put the Detail−10 nut on the end of the arbor and against the shoulder in the ID of the hub. Tighten the nut with the larger spanner wrench.

(14) Connect the PWA 85086 Lifting Arm to the upper lifting eye of the arbor. Attach a hoist to the lifting arm and lift the assembly from the stand.

(15) Connect a second PWA 85086 Lifting Arm to the lower lifting eye.

(16) With a hoist, trunnion the arbor and rotor assembly to the horizontal position. Install the assembly in the PWA 85099 Storage Stand. Remove the hoists.

NOTE: Cover the front and rear sleeves of the arbor with an applicable material. This will prevent possible damage during transport while it is in the PWA 85099 Storage Stand.

(17) Move the arbor and rotor assembly to the balance machine.

(18) Open the cover of the PWA 85097 Shroud. With the two hoists and lifting arms, install the arbor on the rollers of the balance machine. Remove the hoists, lifting arms and lifting eyes from the ends of the arbor.

(19) Connect the arbor to the balance machine with the direct drive and align the index marks on the arbor and the direct drive or install the drive belt to the sand blasted area on the front end of the arbor.

(20) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(21) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(22) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

(a) Replace the Class 1 second stage HPT covers with Class 2 or Class 3 covers opposite the heavy angle as necessary. Hold the blade platform and pull straight back to remove the cover.

NOTE: Second stage HPT Class 1 covers are initially installed at 82 locations.

(b) Static balance the rotor assembly as described above until the residual unbalance is not more than 1.0 oz−in. (720.0 g.mm).

(c) Record the heavy angle and the amount of assembly unbalance.

(23) Optional process based on the experience of the operator, do a check of the balance machine as follows:

(a) Pan weigh an amount of Beeswax P05−395 or Paraffin Wax Blend P05−396 equal to 0.2945 − 0.2955 oz (8349.0 − 8377.0 mg).

(b) Put the wax on the rear face of the plate in line with the outer edge of the Detail−7 front retainer as close as possible to the angle of residual unbalance.

NOTE: This point is equal to a radius of 13.560 in (344.424 mm).

(c) This amount of beeswax will pull 4.0 oz−in. (2880.0 g.mm).

(d) Do a check of the balance machine at 900 rpm minimum.

(e) The amount of unbalance should pull 4.0 oz−in. (2880.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in (288.0 g.mm).

(f) Remove the beeswax.

(24) Mark the unbalance symbol (triangle) and the amount of unbalance, adjacent to the unbalance symbol (triangle), on the rear side of the disk web at the location of heavy unbalance by SPOP 401 (Task 70−11−00−280−006), Standard Practices Manual, PN 585005. Use the shallow etch method.

NOTE: No burns, pitting or selective attack is permitted on the disk.

(25) Remove arbor and rotor assembly from balance machine and install in PWA 85099 Stand.

(a) Open cover on PWA 85097 Shroud.

(b) Install lifting eyes on ends of arbor.

(c) Connect two hoists with two PWA 85086 Arms to lifting eyes.

(d) Using hoists, install arbor into clamps of PWA 85099 Stand.

NOTE: Front and rear sleeves of arbor should be covered with suitable protective material R to avoid possible damage during transport and storage when in stand.

(26) Remove arbor and rotor assembly from transport fixture and install into PWA 85088 Fixture.

(a) Connect two hoists with two PWA 85086 Arms to lifting eyes on ends of arbor.

(b) Using hoists, remove assembly from stand and trunnion to rear end down (drive end up) position.

(c) Remove lower hoist and PWA 85086 Arm.

(d) Lower assembly and position turbine rear hub onto fixture.

(27) Remove arbor from turbine rear hub.

(a) Remove nut (1001/5) from lower end of arbor.

(b) Using wrench supplied with arbor, loosen hydraulic actuating screw to allow removal of arbor.

(c) Remove three bolts (1001/1) securing retainer (1001/2) to arbor. Remove retainer.

(d) Temporarily secure spacer (1001/3) to adjacent spacer using standard 3 inch (76.200 mm) C−clamp.

(e) Connect hoist, with PWA 85086 Arm to upper lifting eye of arbor. Using hoist, lift arbor from turbine rear hub.

(f) Remove C−clamps and remove spacer (1001/3).

(g) Connect hoist with PWA 85086 Arm to lower lifting eye on arbor.

(h) Using both hoists, trunnion arbor to horizontal position and install arbor in storage box. Remove hoists and arms.

STAGE 2 TURBINE ROTOR ASSEMBLY - ASSEMBLY-03

Task 72-52-02-440-003:

1. Static Balance Stage 2 Turbine Rotor Assembly (Vertical Balance Method)

A. Prerequisites

(1) Assemble 2nd stage turbine rotor assembly. Refer to Assembly-01 Task 72-52-02-440-001.

B. Equipment And Materials Necessary

Standard Tools

Scale, Mass Weight

Special Tools:

PWA 85088	Fixture, Support
PWA 86427	Arbor, Balance
PWA 86535	Fixture, Lift

Consumable Materials:

Item No.	Designation
P05-395	Beeswax
P05-396	Paraffin Wax Blend

C. Procedure

(1) Install PWA 86427 Arbor onto the vertical balance machine.

(2) Position PWA 86535 Lift Fixture in the front bore of the hub as follows:

(a) Lift the lock pin and engage the fixture on the hub and lock the fixture to the hub by moving the lock pin down below the shown "Locked" line. R

(b) With a hoist, install the rotor on the arbor. Align the splines of the hub with the spline drives of the arbor. Remove the lift fixture.

(3) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

STAGE 2 TURBINE ROTOR ASSEMBLY − ASSEMBLY−03

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(4) Remove the rotor assembly from the balance machine as follows:

(a) Install the PWA 86535 Lift Fixture in the front bore of the hub as follows:

1 Lift the lock pin and engage the fixture on the hub and lock the fixture to the hub by moving the lock pin down.

(b) With the hoist, lift the rotor assembly from the balance arbor. Index (turn) the rotor assembly 180 degrees and lower the assembly on the arbor.

(c) Remove the hoist and the PWA 86535 Lift Fixture.

(5) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(6) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(7) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

(a) Replace the Class 1 second stage HPT covers with Class 2 or Class 3 covers opposite the heavy angle as necessary. Hold the blade platform and pull straight back to remove the cover.

NOTE: Second stage HPT Class 1 covers are initially installed at 82 locations.

(b) Static balance the rotor assembly as described above until the residual unbalance is not more than 1.0 oz−in. (720.0 g.mm).

(c) Record the heavy angle and the amount of assembly unbalance.

(8) Optional process based on the experience of the operator, do a check of the balance machine as follows:

(a) Pan weigh an amount of Beeswax P05−395 or Paraffin Wax Blend P05−396 equal to 0.2945 − 0.2955 oz (8349.0 − 8377.0 mg).

(b) Put the wax on the front face of the blade inward of the blade tang as close as possible to the angle of residual unbalance.

NOTE: This point is equal to a radius of 13.560 in (344.424 mm).

(c) This amount of beeswax will pull 4.0 oz−in. (2880.0 g.mm).

(d) Do a check of the balance machine at 900 rpm minimum.

(e) The amount of unbalance should pull 4.0 oz−in. (2880.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in (288.0 g.mm).

(f) Remove the beeswax.

(9) Mark the unbalance symbol (triangle) and the amount of unbalance, adjacent to the unbalance symbol (triangle), on the rear side of the disk web at the location of heavy unbalance by SPOP 401 (Task 70−11−00−280−006), Standard Practices Manual, PN 585005. Use the shallow etch method.

NOTE: No burns, pitting or selective attack is permitted on the disk.

(10) Remove the rotor assembly from the balance machine as follows:

(a) Install the PWA 86535 Lift Fixture in the front bore of the hub.

(b) Lift the lock pin and engage the fixture on the hub and lock the fixture to the hub by moving the lock pin down.

(c) With a hoist, install the rotor on the PWA 85088 Support Fixture.

(d) Remove the hoist and lift fixture.

(11) Remove the arbor from the balance machine.

TURBINE CASE AND VANE ASSEMBLY - DISASSEMBLY-01

Task 72-52-03-040-001:

1. Disassemble Turbine Case And Vane Assembly
   A. Equipment And Materials Required

      Special Tools:

      PWA 76154 Adapter (Two Necessary)
      PWA 78024 Adapter, Driver
      PWA 85247 Brackets, Handling (Two Necessary)
      PWA 85290 Ring, Support (Optional to PWA 87003)
      PWA 86504 Adapter, Wrench
      PWA 87003 Ring, Support
      PWA 87005 Retainer, Holding
      PWA 87199 Puller, Jackscrews
      PWA 87753 Table, Rotary (Optional)
      PWA 88645 Sling, Lifting (Optional to PWA 88673)
      PWA 88673 Sling, Lifting (Optional to PWA 88643)

   B. Procedure
      (1) Position turbine case and vane assembly on workbench.
         (a) Position PWA 87003 or PWA 85290 Ring (chamfered end up) onto workbench.

            NOTE: The Ring (PWA 87003 or PWA 85290) can be positioned on an optional PWA 87753 Rotary Table to make the assembly procedure easier.

         (b) With turbine case front flange (smaller ID) down, position two PWA 85247 Brackets 180 degrees apart between front and rear flanges of case. Position brackets with dowel pins protruding through bolthole in rear flange of case. Install seven screws through boltholes in front flange of turbine case and into brackets. Tighten screws.
         (c) Connect PWA 88643 or PWA 88673 Sling with two PWA 76154 Adapters to trunnion spools on Brackets (PWA 85247). Using hoist, position turbine case with front end (smaller OD) down, over Ring (PWA 87003 or PWA 85290). Align boltholes and lower case onto ring, with bolt details of bracket in clearance cutouts of ring. Secure case to ring with eight detail screws.
         (d) Disconnect hoist, sling and adapters. Allow brackets to remain in place.

TURBINE CASE AND VANE ASSEMBLY − DISASSEMBLY−01

(2) Locate dowel pin hole on turbine case OD flange (bottom vertical centerline) as reference. Insure that all vanes assemblies, ducts and duct support segments are numbered consecutively starting at top vertical center line and proceding in clockwise direction as viewed from rear. See Figure 501 for location of parts marked No. 1. See Figure 502 for part marking areas.

(3) Inspect ID of 2nd stage HPT duct segments for damage. Duct segments exhibiting damage should not be reinstalled.

(4) Loosen 21 bolts (503/1) and 21 bolts (503/2) securing 2nd stage HPT duct support segments (502/4) and vanes to case using PWA 86504 Wrench. Use PWA 78024 Adapter, with a ratcheting box wrench (such as Snap−on GRES810) to remove the bolts. Remove 21 spacers (503/3). See Figure 503.

(5) Remove 2nd stage HPT seal, duct supports and duct segments from case and vane assembly. Use PWA 87199 Jackscrew Puller.

  (a) Remove the jackscrews from the storage locations and put them through the large hole in each HPT duct support so they are resting on the legs of the vane assemblies.

  (b) Open the puller and place it under the 2nd stage HPT seal and on top of the jackscrews. Lock the puller halves together with the ball lock pin.

  (c) Turn each jackscrew with equal pressure until the duct supports are loose. See Figure 504.

  (d) Position seal and duct assembly on bench, with 2nd stage HPT seal end down.

(6) Remove upper gasket (505/4) and (21) 2nd stage HPT duct segments (505/7) from duct supports. Remove seals (505/8) from slots between duct segments. Remove lower gasket (505/6). See Figure 505.

(7) Remove three 2nd stage HPT band segments (505/2) from ID of 2nd stage HPT duct supports.

(8) Remove 21 2nd stage HPT duct supports (505/2) from 2nd stage HPT seal (505/3). The 2nd stage duct supports should be kept together and inspected for wear. See 72−52−37, Inspection/Check−04 (Task 72−52−37−200−004).

(9) Remove the screws that secure the turbine case front flange to the Support (PWA 85290 or PWA 87003).

(10) Put a suitable support over the vanes to prevent them from dropping out during the following trunnioning procedure.

(11) Use a hoist to connect a Sling (PWA 88643 or PWA 88673) with two Adapters (PWA 76154) to the trunnion spools of Brackets (PWA 85247).

(12) Use the hoist to trunnion the case and vane assembly to the rear end down position. Lower the case onto a suitable support. Remove the hoist, sling and adapters. Carefully remove the temporary vane support.

(13) Remove 21 2nd stage HPT vane clusters. Install one PWA 87005 Retainer into the bolt holes of each vane cluster to prevent separation of the vane cluster at the feather seal joints. Remove seals from seal grooves between vane clusters. See Figure 506.

(14) Remove 21 1st stage HPT duct segments (507/2) from duct supports. Remove gasket (507/1) from duct segments. Remove 1st stage HPT duct seals (507/3) from seal grooves between duct segments.

(15) Remove three 1st stage HPT band segments (507/4) from ID of 2nd stage HPT duct supports.

(16) Remove gasket (507/5) from duct supports.

(17) Remove 21 1st stage HPT duct supports (508/3) from turbine case. Remove 21 each of 1st stage HPT duct support seals (508/1) and (508/2) from ends of duct supports.

(18) Connect hoist and Sling (PWA 88643 or PWA 88673) with two Adapters (PWA 76154) to the trunnion spools on the two installed (PWA 85247) Brackets. Use a hoist to put the turbine case on a pallet. Remove sling and adapters. Remove brackets from case.

(Task 72-52-03-040-001)

Task 72-52-03-440-001:

1. Assemble Turbine Case And Vane Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-52-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (Two Necessary)
PWA 78024	Adapter, Driver
PWA 85103	Fixture, Assembly
PWA 85104	Fixture, Assembly
PWA 85247	Brackets, Handling (Two Necessary)
PWA 85290	Ring, Support (Optional to PWA 87003)
PWA 85543	Pins, Aligning (Three Necessary)
PWA 86504	Adapter, Wrench
PWA 86595	Drift
PWA 87003	Ring, Support
PWA 87753	Table, Rotary (Optional)
PWA 87782	Gage, Mounting Distance (Optional)
PWA 87885	Cutter, Cover
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling (Optional to PWA 88643)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-395	Beeswax
P05-396	Paraffin Wax Blend

C. Procedure

CAUTION: DETAIL PARTS OF TURBINE CASE AND VANE ASSEMBLY MUST BE KEPT TOGETHER AS A SET. SEE FIGURE 1001 FOR PART MARKING AREAS. PARTS MUST BE ASSEMBLED CONSECUTIVELY CLOCKWISE AS VIEWED FROM REAR.

(1) Put PWA 87003 or PWA 85290 Support (chamfered end up) on a workbench or PWA 87753 Rotary Table.

NOTE: The HPT case and vane assembly can be assembled with a PWA 87003 or PWA 85290 Support Ring. The Support Ring (PWA 87003) provides torque screws to pre-load the 1st stage duct support segments and band segments. This prevents them from moving radially outward during the following assembly procedure.

(2) Position turbine case on the support ring.

NOTE: For engines that incorporate a 2nd stage HPT borescope provision, you must use a HPT case assembly that has a hole to accept the locating pin of vane at the 8 o'clock position (Reference SB PW4ENG 72-157).

(a) With turbine case front flange (smaller ID) down, position two PWA 85247 Brackets 180 degrees apart between front and rear flanges of case. Position brackets with dowel pins protruding through bolthole in rear flange of case. Install seven screws through boltholes in front flange of turbine case and into brackets. Tighten screws.

(b) Connect PWA 88643 or PWA 88673 Sling with two PWA 76154 Adapters to trunnion spools on PWA 85247 Brackets.

(c) Use a hoist to put the turbine case, with the front flange (smaller OD) down, over the support ring. For Support Ring (PWA 87003), align the offset bolthole in the front flange of the case with the scribed line on the outer surface of the ring. Align the boltholes and lower the case onto the ring. Secure the case to the ring support with detail bolts and nuts as applicable.

CAUTION: PRE AND POST SB PW4ENG 72-313 1ST STAGE HPT DUCT SUPPORTS AND SEALS (SHEET MELTAL) MUST BE USED IN SETS.

(3) Install 1st stage HPT duct supports into turbine case.

(a) Locate the positioning groove in the front ID flange of the turbine case as shown in Figure 1002.

(b) Position the 1st stage HPT duct support (1002/3) marked No. 1 into the inner groove of the turbine case. The center locating pin (1002/2) in the support must engage the locating pin slot in the front ID flange of the turbine case as shown.

NOTE: Support marked No. 1 incorporates three square locating pins. The remaining supports incorporate one square locating pin.

(c) Assemble 1st stage duct support seals into seal grooves between adjacent supports. Install remaining 20 supports into case in numerical order and in clockwise direction as viewed by operator. Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain seals in position. See Figure 1003 for seal locations.

(d) For Support Ring (PWA 87003), tighten the 21 adjustable torque thumbscrews until the screws will not turn anymore. See Figure 1004.

(e) Install three 1st stage HPT band segments (1005/4) into inner groove in 1st stage HPT duct supports (1005/6) engaging seven cutouts in each band segments into pins of supports. Ensure that tabs on ends of all band segments are on outside of adjacent segments.

(f) Install gasket (1005/5) onto ID face of 1st stage HPT duct supports.

(4) Install 1st stage HPT duct segments.

CAUTION: USE EXTREME CARE WHEN HANDLING DUCT SEGMENTS TO AVOID FLAKING OR CHIPPING CERAMIC COATING.

CAUTION: IF ONE OR MORE NEW DUCT SEGMENTS ARE INSTALLED, NEW OR ACCEPTABLE BLADE TIP ABRASIVE PARTICLES ARE REQUIRED ON
R 30 OF 60 1ST STAGE BLADES. FAILURE TO REPLACE BLADE TIP ABRASIVE PARTICLES WILL DECREASE ENGINE PERFORMANCE AND

CAUSE MORE BLADE TIP WEAR THAN THE REPAIR LIMITS ALLOW.

CAUTION: IF NO NEW DUCT SEGMENTS ARE INSTALLED AND ONE OR MORE 1ST OR 2ND STAGE DUCT SEGMENTS PRETRENCHED BY CHAPTER/SECTION 72-52-32 OR 72-52-35, REPAIR-02, PW4000 Series CIR, PN 51A357, ARE INSTALLED, R THE REQUIREMENTS FOR 30 BLADES WITH SUITABLE BLADE TIPS IS WAIVED.

CAUTION: PRE AND POST SB PW4ENG 72-313 DUCT SEGMENTS, 2ND STAGE HPT RING SEGMENT AND VANE CLUSTER ASSEMBLIES, AND SEALS (SHEET METAL) MUST BE USED IN SETS.

(a) If you put back the duct segments you used before: make sure that all duct segments have the same mating number as the serial number of the detail case.

(b) Obtain 1st stage HPT duct (1005/2) marked No. 1. Align slot in foot detail of duct with dowel pin in rear groove of duct support marked No. 1 and install duct segment (chamfered end down) into outer groove in duct support (1005/6). Using hand pressure only, partially seat duct segment. See Figure 1006 for duct positioning.

(c) Assemble 1st stage duct seals (1005/3) into seal grooves between adjacent duct segments. Use Beeswax P05-395 or Paraffin Wax Blend P05-396, as required to retain seals in position. Install and seat remaining duct segments No. 21 through No. 2, in sequence, in counterclockwise direction into duct supports per previous step.

NOTE: Installing duct segments in counterclockwise direction aids in aligning locating pin slots in ducts with locating pins in supports.

(d) Install gasket (1005/1) into groove at rear of duct segments.

TURBINE CASE AND VANE ASSEMBLY − ASSEMBLY−01

CAUTION: PRE AND POST SB PW4ENG 72−313 2ND STAGE HPT RING SEGMENT AND VANE CLUSTER ASSEMBLIES, DUCT SEGMENTS, AND SEALS (SHEET METAL) MUST BE USED IN SETS.

CAUTION: PRE AND POST SB PW4ENG 72−315 2ND STAGE HPT RING SEGMENT AND VANE CLUSTER ASSEMBLIES, AND SEALS (SHEET METAL) MUST BE USED IN SETS.

(5) Install 2nd stage HPT vanes into PWA 85103 Fixture. See Figure 1007 and Figure 1008.

NOTE: Second stage HPT vane cluster assemblies must be used in sets with (orifice) plate/gasket assemblies and gaskets during engine assembly. The plate/gasket assemblies and gaskets will be installed on the turbine case tube pads in 72−00−53, Installation−03 Task 72−00−53−420−003.

(a) Connect hoist to hoist rings and position fixture onto bench.

(b) Loosen bolts and remove top ring clamp (1008/1) from fixture.

(c) Install vane marked No. 1 over fixture base (1008/2) with vane front inner buttress on base plate and outer buttress on bench.

CAUTION: SECOND STAGE HPT RING SEGMENT AND VANE CLUSTERS ASSEMBLIES AND SEALS MUST BE USED IN SETS.

(d) Assemble 2nd stage HPT seals into seal grooves between adjacent vanes. Install remaining 20 vanes into fixture in numerical order in clockwise direction as viewed by operator. Install remaining seals between vanes of cluster assemblies. Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain seals in position. See Figure 1007 for seal locations.

NOTE: Engines incorporating a 2nd stage HPT borescope provision, at 8 o'clock location, requires a vane assembly with a borescope provision located at the 13 vane cluster position. (Post SB PW4ENG 72−157).

(e) Push all vanes up against fixture outer snap diameter.

(f) (Reference 1725) Check gap between adjacent vane clusters at outer platform of vanes. Temporarily shim as required to obtain 0.028 inch (0.711 mm) minimum gap between vane clusters.

(g) Position ring clamp (1008/1) over fixture post details and vane inner buttresses. Rotate ring clamp clockwise tighten screws to secure vanes.

(6) Install gasket into outer front groove in turbine case.

(7) Install vane assembly into turbine case.

(a) Connect suitable three cable sling to hoist rings on PWA 85103 Fixture.

(b) Using hoist, position vane assembly over turbine case. Locate turbine vane marked No. 1 as shown in Figure 1009.

(c) Align boltholes in vane lugs with boltholes in turbine case and lower vane assembly gussets into circumferential grooves in duct and duct support segments. Tap vanes into position.

(d) Install 0.3125−24 workbolts, threads lubricated with Engine Oil P03−001, into boltholes of all vane assemblies and engage nuts in case.

(e) Loosen bolts and remove ring clamp (1008/1) of fixture. Lower base (1008/2) onto bench. Remove hoist and sling.

(f) Repeat following procedure until all vane assemblies are seated. Progressively tap OD shroud faces of vane assembly and tighten down workbolts until bolthead face makes contact with case flange. Continue this procedure until all vanes are seated against case flange.

(8) Assemble 2nd stage HPT seal, duct supports and duct segments into PWA 85104 Fixture . See Figure 1010.

(a) Using Sling (PWA 88643) or (PWA 88673), and two Adapters (PWA 76154) connected to trunnion spools, position Fixture (PWA 85104) onto suitable rotary build table.

(b) Loosen and retract six outer clamp details (1010/10).

(c) Install 2nd stage HPT seal (1010/8) (larger diameter down) into machined step in fixture.

(d) Obtain 2nd stage HPT duct supports. Used supports must be installed in set. See Chapter/Section 72−52−37, Inspection/Check−04 in the PW4000 Series CIR, PN 51A357.

NOTE: When you assemble used supports in sets, the closer the wear dimensions are matched, the less air leakage will be present.

(e) Position 2nd stage HPT duct support (1010/5) or (1010/7) as applicable, marked No. 1 into inner diameter of outer 2nd stage HPT seal and onto top machined step of pilot ring detail. Centralize duct support relative to one hand knob (1010/9).

(f) Assemble 2nd stage HPT duct support seals per Figure 1010 into seal grooves between adjacent duct supports. Assemble seals into seal grooves and install remaining 20 duct supports in numerical order in counterclockwise direction as viewed by operator. Use Beeswax P05−395 or Paraffin Wax Blend P05−396 as required to retain seals in position. See Figure 1010 for seal locations.

(g) (Reference 1726) Check gap between adjacent duct supports. Adjust supports as required to obtain a gap of 0.027 inch (0.686 mm) minimum between supports. See Figure 1009, (Sheet 2).

(h) Install three 2nd stage HPT band segments (1011/4), with sloted edge down, into inner channel of previously installed duct supports. Engage slots in band segments with pins in supports. Ensure that small plates on ends of band segments are on outside of adjacent segments.

(i) Install gasket (1011/5) onto top surface of duct support inner lip.

CAUTION: USE EXTREME CARE WHEN HANDLING DUCT SEGMENTS TO AVOID FLAKING OR CHIPPING CERAMIC COATING.

CAUTION: IF ONE OR MORE NEW OR REPAIRED DUCT SEGMENTS ARE INSTALLED, NEW OR ACCEPTABLE BLADE TIP ABRASIVE PARTICLES
R ARE REQUIRED ON 30 OF 82 2ND STAGE BLADES. FAILURE TO REPLACE BLADE TIP ABRASIVE PARTICLES WILL DECREASE ENGINE PERFORMANCE AND CAUSE MORE BLADE TIP WEAR THAN THE REPAIR LIMITS ALLOW.

(j) If you put back the duct segments you used before: make sure that all duct segments have the same mating number as the serial number of the detail case.

(k) Position 2nd stage HPT duct segment (1011/2), with chamfered end up, onto previously installed 2nd stage HPT duct support marked No. 1. Install duct segment with locating pin (1012/3) in duct support engaged in locating pin slot (1012/1) between feet details of duct. Tap duct segment as necessary to seat. See Figure 1012.

(l) Install and seat remaining duct segments No. 21 through No. 2 in sequence, in counterclockwise direction into duct supports per previous step.

NOTE: Installing duct segments in counterclockwise direction aids in aligning locating pin slots in duct segments with locating pins in supports.

(m) Assemble 2nd stage HPT duct seals (1011/3) into grooves between adjacent ducts. Install remaining 20 ducts in numerical order in counterclockwise direction as viewed by operator. Lightly clamp duct segments using hand knobs. Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain seals in position.

(n) Install gasket (1011/1) into circumferential ID groove in upper flange of duct segments. Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain gasket in position.

(o) (Post PW4ENG 72−462) Install gasket (1011/6) on the ID face of the support segments and the front OD formed by the 2nd stage HPT band segments. Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain seal in position.

(p) Slide six detail clamps (1010/10) inward and tighten bolts to secure 2nd stage HPT seal (1010/8) to fixture.

(q) Position PWA 87880 Clamp around the outside diameter of the duct supports and tighten the clamps. The assembly can now be trunnioned and the seal, duct supports and duct segments will stay in position.

(9) Remove 21 workbolts (1013/1) from the vane cluster right vanes (1013/2). See Figure 1013.

(10) Thread three PWA 85543 Aligning Pins into equally spaced boltholes in rear flange of HPT case.

(11) Using Sling (PWA 88643) or (PWA 88673) and two Adapters (PWA 76154) connected to trunnion spools on fixture, trunnion assembly to front end down position.

(12) Position duct assembly over turbine case locating duct support marked No. 1 as shown in Figure 1009. Position boltholes in duct support over aligning pins and lower duct support assembly onto turbine case inner flange.

(13) Remove the PWA 85104 Fixture.

(14) Remove alignment pins.

CAUTION: DO NOT USE A DRIFT TO ALIGN BOLTHOLES IN 2ND STAGE HPT DUCT SUPPORTS WITH BOLTHOLES IN THE TURBINE CASE AND THE VANE OD FLANGES. THE USE OF A DRIFT CAN DAMAGE THE NUT PLATES ON THE TURBINE CASE REAR INNER FLANGE.

(15) Install 21 bolts (1014/1) lubricated with Engine Oil P03−001 through holes in the 2nd stage HPT duct

supports. Thread the bolts into the case nuts. Use PWA 78024 Adapter, with a ratcheting box wrench (such as Snap−on GRES810), to tighten the bolts until they touch the duct supports. See Figure 1014.

(16) Remove 21 workbolts from the larger diameter holes in the duct supports.

(17) Install 21 spacers (1014/2), flanged end up, into the larger holes in the duct supports (1014/3).

(18) Install 21 bolts (1014/2), lubricated with Engine Oil P03−001, through the spacers and into the case nuts. Use PWA 78024 Adapter, with a ratcheting box wrench (such as Snap−on GRES810), to tighten the bolts until contact is made with the spacer face.

(19) Use PWA 86595 Drift, as required, to seat the vanes and vane supports in the case. See Figure 1015.

(20) Loosen the 21 adjustable torque thumbscrews details of Support Ring (PWA 87003).

(21) (Reference 1725) Check gap between adjacent vane clusters at outer platform of vanes. See Figure 1009, (Sheet 2).

(22) Remove the screws and nuts as applicable that secure the case to the support ring. Connect Sling (PWA 88643) or (PWA 88673) with two PWA 76154 Adapters to the trunnion spools on PWA 85247 Brackets. Lift the assembly from the support ring. Position a suitable support on workbench under the vane front inner platform, Surface K.

CAUTION: WHEN USING PWA 85106 WRENCH ADAPTER THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT STATED BELOW. SEE STANDARD TORQUES IN 70−52, STANDARD PRACTICES MANUAL, PN 585005.

(23) With the assembly supported on Surface K and the vanes seated on Surfaces J and L, torque the bolts (1014/1). Use PWA 86504 Wrench Adapter. Torque bolts (1014/1) to 180 − 200 lb−in (20.337 − 22.597 N.m). Loosen each bolt to 0 lb−in. (0 N.m), and retorque to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(24) Use standard tools or optional PWA 87782 Gage to check the seating of parts. Refer to the requirements of Figure 1016.

(25) Remove shims as required.

(26) Put a protective cardboard cover over the assembly to prevent damage to the vanes from unwanted materials. If necessary, you can use PWA 87885 Cutter to make the cardboard cover.

LOW PRESSURE TURBINE (LPT) - HOW TO USE

Task 72-53-00-990-003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant Low Pressure Turbine (LPT) parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED -	This designation is for numbers intentionally omitted and reserved for possible future use.
NOT USED -	This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

LOW PRESSURE TURBINE (LPT) - DESCRIPTION AND OPERATION

Task 72-53-00-990-002:

1. Low Pressure Turbine

A. General

See Figure 1.

(1) The low pressure turbine (LPT) provides the rotational driving force for the low pressure compressor. This is done in the same manner as the high pressure turbine, by extracting some of the thrust energy from the combustion gases, directed by the stator vanes, at the rotor stages and transforming this energy into motional energy or work. This work energy produced by the low pressure turbine is used to drive the low pressure compressor through a turbine shaft, running through the center of the engine.

(2) The low pressure turbine consists of four rotor stages and four stator vane stages. Cooling air is provided to the low pressure turbine to reduce and regulate temperatures at the forward ID case wall (to the 4th vane hook), the blade root disk rim and fir tree areas and the inner rotor cavity areas. An automatic turbine rotor clearance control system is incorporated to increase the operating efficiency at cruise conditions. This is accomplished by cooling and shrinking the case with fan discharge air to provide optimum blade tip and seal clearances. A removable plug located at 4:30 o'clock position provides access for borescope inspection of the high pressure turbine 2nd stage, and the 3rd stage of the low pressure turbine. See Figures 2 and 3.

B. Low Pressure Turbine Rotors

(1) The low pressure turbine rotors are of a cantilevered rotor design, with the 5th stage rear turbine hub is the primary rotating structural member. The 5th stage hub provides a bolted attachment provisions for the front compressor drive turbine shaft at the ID and the 4th and 6th stage LPT disks near the OD. The 4th stage disk is a cantilevered disk, mounted forward of the 5th stage hub with a bolted attachment to the 3rd stage disk. The 6th stage turbine rotor is cantilevered to the rear from the 5th stage hub.

LOW PRESSURE TURBINE (LPT) − DESCRIPTION AND OPERATION

(2) Between the 3rd and 4th, and 4th and 5th stage turbine rotor assemblies are rotating knife−edge airseals which are locked in place by the disks. The airseal knife−edges along with the integral knife−edges on the 6th stage disk align with an abradable honeycomb vane inner seal land to form the vane inner seal. This seal prevents gaspath leakage around the ID of the vanes.

(3) The 3rd stage rotor blades are coated with an aluminized coating, and remaining stages are uncoated. Outer shrouds of the turbine blades incorporate interlocking hardfaced notches, and double knife−edge seals except for the 6th stage which has a single knife−edge. These knife−edges align with abradable honeycomb (outer) airseal land segments installed in the turbine case.

LOW PRESSURE TURBINE (LPT) - REMOVAL-01

Task 72-53-00-020-001:

1. Remove Turbine Exhaust Case From Low Pressure Turbine

NOTE: See Figure 301 for part/assembly removal sequence.

A. Prerequisites

(1) Remove The Low Pressure Turbine And Turbine Exhaust Case With Shaft. Refer to 72-00-53, Removal-08 (Task 72-00-53-020-002).

B. Equipment And Materials Necessary

Standard Tools:
0.190-32 Jackscrews (12 necessary)

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 25040	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
PWA 25041	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
PWA 28374	Guide (Optional To PWA 85850)
PWA 28414	Bracket, Support (Optional To PWA 85195 For Engine Horizontal Support)
PWA 28657	Sling, Strongback
PWA 29243	Bracket, Support (2 Necessary) (Optional To PWA 85195 Brackets For Engine Horizontal Support)
PWA 29389	Pump, Hydraulic
PWA 75284	Puller, Knocker
PWA 75995	Support And Guide (Optional To PWA 102178)
PWA 76154	Adapter (2 necessary)
PWA 85195	Bracket Support (Optional To PWA 25040, PWA 25041, PWA 28414, PWA 29243)
PWA 85305	Pins, Aligning (2 necessary)
PWA 85431	Puller, Hydraulic
PWA 85432	Puller, Hydraulic
PWA 85434	Puller, Jackscrew
PWA 85583	Fixture, Support
PWA 85850	Guide (Optional To PWA 28374)
PWA 86438	Adapter
PWA 102178	Support, Rear (Optional To PWA 75995)

C. Procedure

LOW PRESSURE TURBINE (LPT) − REMOVAL−01

(1) Install PWA 85195, PWA 29243, PWA 25040 and PWA 25041, or PWA 28414 Support Brackets to turbine exhaust case at 3 and 9 o'clock locations. See Figure 302.

NOTE: PWA 29243 or PWA 28414 Brackets may be used in place of PWA 85195 Brackets for horizontal support only.

NOTE: PWA 25040 and PWA 25041 Brackets may be used in place of PWA 85195 Brackets on engines with exhaust nozzle removed.

(a) Position brackets between case rails and align holes.

NOTE: If applicable, install PWA 25040 Bracket at 3 o'clock and PWA 25041 Bracket at 9 o'clock positions.

(b) For PWA 85195 Brackets or PWA 25040 and PWA 25041 Brackets, install pin from rear through flange and bracket. Secure pin with safety pin as necessary.

(c) For other brackets, insert pin through flanges and bracket and install bushings through flanges and into bracket. Secure pins with nuts.

(2) Attach PWA 28657 Sling, two PWA 76154 Adapters and hoist to spools on exhaust case at 3 and 9 o'clock.

(3) Remove No. 4 bearing retaining plate (303/3). See Figure 303.

(a) Remove bolts (303/4) securing retaining plate to front compressor drive turbine shaft (303/1).

(b) Rotate knurled nut detail of PWA 75284 Knocker Puller to retract jaws. Install puller onto retaining plate with jaws in line with slots in retaining plate wall. Tighten knurled nut to secure jaws in retaining plate. Using slide hammer, remove retaining plate from shaft. Remove puller.

(c) Discard packing (303/2).

(4) Install PWA 75995 Support, PWA 86438 Adapter, and PWA 28374 Guide to the front compressor drive turbine shaft (304/7) and the exhaust case. See Figure 304.

NOTE: See the step that follows to install the optional support and guide tools.

(a) Align the boltholes and put the PWA 75995 Support against the turbine shaft. Install the support with eight screws (304/5).

(b) Install the PWA 28374 Guide on the support shaft and put it against the turbine shaft.

(c) Install the PWA 85696 Adapter on the support shaft and move it toward the exhaust case. Align the boltholes and install the adapter with five screws (304/6).

(5) Install the optional PWA 102178 Support and PWA 85850 Guide to the front compressor drive turbine shaft (304/7) and the exhaust case. See Figure 304.

(a) Align the boltholes and put the support (304/3) against the turbine shaft. Install the support with eight screws (304/1).

(b) Install the PWA 85850 Guide on the shaft and put it against the turbine shaft.

(c) Install the adapter (304/4) on the support (304/3) and move it toward the exhaust case. Align the boltholes and install the adapter with five screws (304/2).

(6) Position 12 to 16 brass shims equally spaced over 90 - 100 degree arc. Place shims just to rear of knife-edge seal between 6th stage blade outer shrouds and 6th stage air sealing ring segments.

(7) Adjust the sling and hoist attached to the spools on the exhaust case to support the case when separating it from the low pressure turbine.

(8) Remove Flange P bolts, nuts and brackets securing turbine exhaust case to turbine case. Refer to 72-00-54, Removal-20 (Task 72-00-54-020-005).

(9) Install two PWA 85305 Aligning Pins, 180 degrees apart, in Flange P.

(a) Locate smaller .190−32 threaded bolthole in the exhaust case and secure plate to rear of exhaust case using detail screw.

(b) Insert two aligning pins through boltholes in turbine case flange and thread into tapped holes in plate.

(10) Using twelve 0.190−32 Jackscrews, remove turbine exhaust case from snap diameter of low pressure turbine case.

(11) Move turbine exhaust case rearward approximately 12 inches (304.8 mm).

(12) Install PWA 85583 Fixture to rear flange of turbine rear case. See Figure 305.

(a) Center flange segment (305/5) to rear flange of turbine rear case (305/7) at 12 o'clock location. Secure flange segment to case with six bolts (305/6).

(b) Loosen two jamnuts (305/4). Adjust nut (305/1) to support ID of 6th stage LPT disk (305/3) to maintain proper positioning of low pressure turbine rotor.

(13) Slide turbine exhaust case rearward.

CAUTION: WHEN REMOVING THE TURBINE EXHAUST CASE AND POSITIONING IT ONTO THE PALLET, CARE MUST BE TAKEN NOT TO DAMAGE FRONT END SEAL RING.

(14) Provide suitable support on pallet to protect front end seal. Lower turbine exhaust case, front end down, onto pallet.

(15) Remove adapters, sling and two brackets at 3 and 9 o'clock locations on turbine exhaust case. Remove alignment pins from turbine rear case flange.

(16) Remove tools from front compressor drive turbine shaft and turbine exhaust case. See Figure 306 and Figure 307.

(a) Remove five screws (306/1) that attach the adapter to the inner flange of the exhaust case. Remove the adapter. See Figure 306.

(b) Remove the PWA 28374 or PWA 85850 Guide from the support. See Figure 307.

(c) Remove eight screws (307/1) that attach the PWA 75995 or PWA 102178 Support to the front compressor drive turbine shaft (307/2). Remove the support.

NOTE: Threaded holes near the end of the support can be used with a lifting eye and hoist to hold the support.

CAUTION: ENSURE THAT NO. 4 BEARING INNER AND OUTER RACES ARE KEPT TOGETHER.

(17) Remove No. 4 bearing (rear) seal spacer (308/5) and inner race (308/6) from front compressor drive turbine shaft (308/1) using PWA 85431 Puller. See Figure 308.

(a) Remove jaw retaining ring from puller and slide three jaws outward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner locating ring to turbine shaft with three detail screws.

(c) Slide three jaws inward behind puller lip of No. 4 bearing seal spacer (308/5). Install retaining ring over jaws and seat on lugs of jaws.

(d) Attach PWA 29389 or PWA 3755 Hydraulic Pump to hydraulic cylinder on puller.

(e) Actuate pump to remove inner race and spacer from turbine shaft.

(f) Disconnect hydraulic pump. Remove retaining ring and slide jaws outward. Remove bolts securing locating ring to turbine shaft. Remove puller from engine.

(g) Remove bearing inner race and spacer from turbine shaft and store parts in suitable container.

(18) Remove No. 4 bearing (front) seal spacer (308/3) and No. 4 bearing (carbon) face seal (308/4) using PWA 85434 Puller.

(a) Rotate outer plate to centralize three puller legs between arms of inner plate. Slide three puller legs inward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner plate to turbine shaft with three detail screws.

(c) Slide three puller legs outward to engage puller lip in ID of No. 4 bearing (front) seal spacer. It may be necessary to turn jackscrew to align puller lip on jaws with puller groove in spacer. Rotate outer plate detail to align puller legs with three arms of inner plate detail to secure puller.

(d) Turn center jackscrew to remove seal and spacer.

(e) Rotate outer plate to centralize three puller legs between arms of inner plate. Loosen screws and slide jaws inward. Remove screws securing inner plate to turbine shaft and remove puller from shaft.

(f) Remove (carbon) face seal and seal spacer from turbine shaft and store parts in suitable containers.

(19) Remove 6th stage LPT airseal (308/2) from LPT (rear hub) (308/1) using PWA 85432 Puller.

(a) Remove jaw retaining ring from puller and slide four jaws outward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner locating ring to turbine shaft with two detail screws.

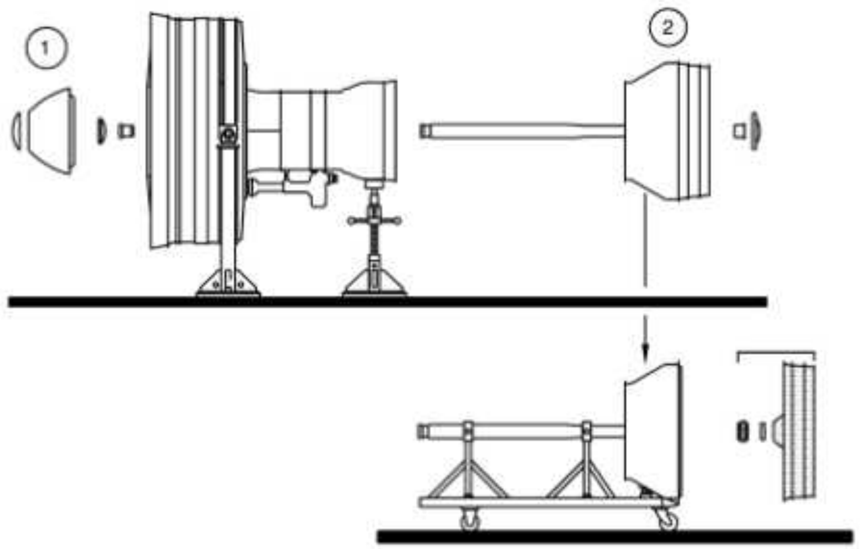
(c) Slide four jaws inward, engaging puller legs in four holes in side of airseal. Install retaining ring over jaws and seal on lugs of jaws.

(d) Attach PWA 29389 or PWA 3755 Hydraulic Pump to hydraulic cylinder on puller.

(e) Actuate pump to remove airseal from turbine shaft.

(f) Disconnect hydraulic pump. Remove retaining ring and slide jaws outward. Remove bolts securing locating ring to turbine shaft. Remove puller from engine.

(g) Remove airseal from turbine shaft and store in suitable container.



1. REMOVE COMPRESSOR INLET CONE
2. REMOVE LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE WITH SHAFT

Task 72-53-00-420-001:

1. Install Turbine Exhaust Case To Low Pressure Turbine

NOTE: See Figure 401 for part/assembly installation sequence.

A. Prerequisites

(1) See 72-53-00, Inspection/Check-01 Task 72-53-00-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

	PWA 25040	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
	PWA 25041	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
	PWA 28374	Guide (Optional To PWA 85850)
	PWA 28414	Bracket, Support (Optional To PWA 85195 For Engine Horizontal Support)
	PWA 28657	Sling, Strongback
	PWA 29243	Bracket, Support (2 Necessary) (Optional To PWA 85195 Brackets For Engine Horizontal Support)
	PWA 75995	Support And Guide (Optional To PWA 102178)
	PWA 76154	Adapter (2 Necessary)
	PWA 85195	Bracket, Support (2 Necessary)
	PWA 85305	Pins, Aligning (2 Necessary)
	PWA 85452	Eye, Lifting (Optional To PWA 28657)
R R	PWA 85453	Drift, Install (Optional to PWA 106326)
	PWA 85850	Guide (Optional To PWA 28374)
	PWA 86438	Adapter
	PWA 102178	Support Rear (Optional To PWA 75995 And PWA 86438)
R R	PWA 106326	Drift, Install (No. 4 Bearing Inner Race, Seals, And Spacers)

LOW PRESSURE TURBINE (LPT) − INSTALLATION−01

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72−54−00/4/90

C. Procedure

(1) Ensure that No. 4 bearing (carbon) face seal gap dimensional requirement (Reference 829) is met.

(2) (Reference 1003) Install No. 4 bearing inner race, face seal (carbon) and seal spacers (front) and (rear). See Figure 402 and Figure 403.

NOTE: All parts must be within ± 10°F (± 5.6°C) when making all measurements.

(a) Stack 6th stage LPT airseal (402/2), No. 4 bearing (front) seal spacer (402/3), No. 4 bearing (rear) seal spacer (402/5) and No. 4 bearing inner race (402/6) on bench. Ensure that zero clearance is maintained between mating faces. Measure overall stacking dimension and record as Dimension N.

(b) Measure dimension from 6th stage airseal shoulder Face P, to rear face of front compressor drive turbine shaft (402/1). Record as Dimension R.

(c) Dimension N − Dimension R must equal 0.005 − 0.020 inch (0.13 − 0.51 mm).

(d) Position 6th stage LPT airseal (403/2) on front compressor drive turbine shaft (403/1). Seat airseal onto shoulder of rear hub using PWA 85453
R or PWA 106326 Drift and mallet.

(e) Install No. 4 bearing (front) seal spacer (403/3), (carbon) face seal (403/4) and (rear) seal spacer (403/5) onto front compressor drive turbine shaft (403/1). Seat parts using PWA 85453
R or PWA 106326 Drift and mallet.

(f) Heat No. 4 bearing inner race (403/6). See Standard Practices Manual, PN 585005.

(g) Install No. 4 bearing inner race onto front compressor drive turbine shaft (403/1). Using PWA 85453 or PWA 106326 Drift, seat inner race and previously installed spacers. R

(h) Measure Dimension S from rear face of No. 4 bearing inner race to rear face of front compressor drive turbine shaft (402/1). See Figure 402.

(i) Dimension S must equal Dimension N - Dimension R plus 0.000 or minus 0.001 inch (plus 0.000 or minus 0.025 mm).

(j) If Dimension S is not within limits, remove bearing inner race, spacers and seals from turbine shaft and repeat steps (d) through (i).

(3) Install PWA 85195 Support Brackets, PWA 29243 Support Brackets, PWA 25040 Support Brackets and PWA 25041 Support Brackets, or PWA 28414 Support Brackets to turbine exhaust case at 3 and 9 o'clock locations. See Figure 404.

NOTE: PWA 29243 Brackets or PWA 28414 Brackets may be used in place of PWA 85195 Brackets for horizontal support only.

NOTE: PWA 25040 and PWA 25041 Brackets may be used in place of PWA 85195 Brackets on engines with exhaust nozzle removed.

(a) Position brackets between case rails and align holes.

NOTE: If applicable, install PWA 25040 Bracket at 3 o'clock and PWA 25041 Bracket at 9 o'clock positions.

(b) For PWA 85195 Brackets or PWA 25040 Brackets and PWA 25041 Brackets, install pin from rear through flange and bracket. Secure pin with safety pin as required.

(c) For other brackets, insert pin through flanges and bracket and install bushings through flanges and into bracket. Secure pins with nuts.

(4) Attach hoist to PWA 28657 Sling. Using two PWA 76154 Adapters attach sling to spools of brackets on case. Raise case from pallet and trunnion to horizontal position.

(5) Install two PWA 85305 Aligning Pins, 180 degrees apart, in Flange P.

(a) Locate smaller .190−32 threaded bolt hole in exhaust case and secure plate to rear of exhaust case using detail screw.

(b) Insert two aligning pins through bolt holes in turbine case flange and thread into tapped holes in plate.

(6) Install PWA 102178 Support and PWA 85850 Guide or PWA 75995 Support, PWA 86438 Adapter and PWA 28374 Guide onto turbine shaft and turbine exhaust case. See Figure 405 and Figure 406.

(a) Align boltholes and insert flanged end of support (support and guide) (405/2) into ID of front compressor drive turbine shaft (405/3). Secure flange to turbine shaft with eight screws (405/1). Install guide over shaft.

(b) Align boltholes and install support (adapter) (406/3) into inner flange of turbine exhaust case. Secure flange to case with five screws (406/2).

(7) Move exhaust case into position at rear of turbine case. Adjust hoist as required and slide support (adapter) (406/3) onto to support (support and guide) (406/1).

(8) Remove PWA 85583 Fixture from low pressure turbine. See Figure 407.

(a) Loosen jamnuts (407/4) and nut (407/1) as required to lower support plate (407/2) from 6th stage LPT disk (407/3).

(b) Remove bolts (407/6) securing flange segment (407/5) to turbine rear case (407/7). Remove fixture.

(9) Slide exhaust case forward, mating bearing rollers on exhaust case with inner race on turbine shaft. Seat exhaust case front flange against turbine exhaust case rear flange.

(10) Install several bolts and nuts equally spaced and evenly tighten nuts to seat snap diameter. Remove aligning pins.

(11) Remove brass shims supporting low pressure turbine rotor. Shims are between 6th stage blade outer shrouds and 6th stage air sealing ring segments.

(12) Install Flange P bolts, brackets and nuts. Refer to 72−00−54, Removal−20 (Task 72−00−54−420−005).

(13) Remove hoist, sling and adapters from turbine exhaust case.

(14) Remove PWA 75995 Support, PWA 86438 Adapter and PWA 28374 Guide from the front compressor drive turbine shaft and the turbine exhaust case. See Figure 408.

NOTE: See the step that follows to remove the optional support and guide tools.

(a) Remove five screws (408/6) that secure the PWA 86438 Adapter to the exhaust case. Remove the adapter.

(b) Remove the PWA 28374 Guide from the support.

(c) Remove eight screws (408/5) that secure the PWA 75995 Support to the turbine shaft (408/7). Remove the support.

NOTE: A lifting eye can be used with the support to help to remove it from the turbine shaft.

(15) Remove the optional PWA 102178 Support and PWA 85850 Guide from the front compressor drive turbine shaft and the turbine exhaust case.

(a) Remove five screws (408/2) that secure the adapter (408/4) to the exhaust case. Remove the adapter.

(b) Remove the PWA 85850 Guide from the support.

(c) Remove eight screws (408/1) that secure the support (408/3) to the turbine shaft (408/7). Remove the support.

NOTE: A lifting eye can be used with the support to help to remove it from the turbine shaft.

(16) Lubricate new packing (409/2) with Engine Oil P03−001 and install packing into groove in front diameter of No. 4 bearing retaining plate (409/3). Align boltholes and install retaining plate into rear inner diameter of front compressor drive turbine shaft (409/1). Secure retaining plate using eight work bolts (409/4). Do not torque bolts. See Figure 409.

(17) Remove support brackets from turbine exhaust case at 3 and 9 o'clock locations.

D. Postrequisites

(1) Install The Low Pressure Turbine And Turbine Exhaust Case With Shaft. Refer to 72−00−53, Installation−08 (Task 72−00−53−420−002).

LOW PRESSURE TURBINE (LPT) - DISASSEMBLY-01

Task 72-53-00-030-001:

1. Remove Low Pressure Turbine Shaft And External Parts

A. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638-5112

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 28657	Sling, Strongback
PWA 29390	Pump, Hydraulic
PWA 29956	Eye, Handling
PWA 85086	Arm, Lifting
PWA 85221	Adapter, Lift And Trunnion
PWA 85331	Retainer, Rear
PWA 85332	Fixture, Handling (Optional To PWA 86026)
PWA 85333	Pusher/Puller, Hydraulic
PWA 85558	Adapter, Hydraulic Cylinder
PWA 85635	Adapter Lift
PWA 85820	Stand, Storage (Optional)
PWA 86026	Fixture, Handling (Optional To PWA 85332)
PWA 86206	Adapter, Lift And Trunnion (2 Necessary)

Consumable Materials:

Item No.	Designation
P05-102	Ice, Dry

B. General Assembly Requirements

(1) Where heating is required for disassembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for disassembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) If only a flange of the component requires heating, the use of Clements Cadillac Electric Flameless Heat Gun, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

C. Procedure
See Figure 501.

(1) Remove turbine case brackets.

(a) Remove lockwire, bolts (501/3) and (501/4), and brackets and (501/2) and (501/5).

(b) For cases with brackets (501/6) and (501/7) that are secured with bolts (Pre SB PW4ENG 72−336), remove lockwire, bolts (501/4) and brackets.

NOTE: Cases that are (Post SB PW4ENG 72−336) have brackets that are riveted to the case. Do not remove these brackets.

(2) Loosen all of the LPT shaft tierod nuts, then remove any one nut. If necessary, the tierod nuts can be flame torch heated as follows:

NOTE: Tierod nuts that are removed by torch heating are not serviceable and can not be re−installed.

(a) Continually monitor the temperature of each nut being heated. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon. Additional monitoring of the adjacent disk and shaft will insure that the rotating structure is not overheated.

(b) Move the torch around the nut to evenly heat it in the area shown in Figure 502.

(c) Apply only enough heat to expand and loosen the tight tierod nut.

(d) Tierod nuts removed by this torch heating can not be re−installed.

(3) Install PWA 85332 Handling Fixture (Optional to PWA 86026 Handling Fixture.

NOTE: See the following step for installation of PWA 86026 Fixture.

(a) Install locator (detail−11) onto tierod where tierod nut has been removed.

(b) Position handling fixture using PWA 85635 Lift Adapter, while locator is installed on one tierod. Locator aligns LPT with fixture.

(c) Slide lockring rearward using two T−handle rods, to expand clamps. Secure lockring with four screws, so that clamps interface with turbine rear hub bore.

(4) Install PWA 86026 Handling Fixture (Optional to PWA 85332 Handling Fixture. See Figure 502.

(a) Install the locator (502/4) on the tierod (502/5) where the tierod nut has been removed.

(b) Measure 5th stage hub flange with template (detail−18). If flange thickness is approximately 0.680 inch (17.272 mm), then install spacer (detail−17). If flange thickness is approximately 0.813 inch (20.650 mm), then spacer is not used.

(c) Position handling fixture using PWA 85635 Lift Adapter, while locator is installed on one tierod. Locator aligns LPT with fixture.

(d) Move the fixture forward until it touches the rear face of the 5th stage hub.

(e) Use a steel rod in the two 0.625 inch (15.875 mm) diameter through holes of the fixture body to align the slots with the tierods in the 5th stage hub. Tighten the four screws (502/3), one at a time, until the four supports (502/2) are correctly engaged at the 5th stage hub bore. Ensure that the detail arms (502/1) are engaged in the step provided in the fixture body.

(5) Install PWA 85331 Rear Retainer. See Figure 503.

(a) Lift retainer, using eyebolts installed in two 0.500−13 tapped holes on rear side of retainer.

(b) Position retainer over previously installed handling fixture and secure to case with 48 screws (503/1) and washers (503/2).

(c) Lock axial position of LPT rotor by tightening eight hand knobs (503/3) against handling fixture.

(6) Using hoist, attach PWA 28657 Sling and two PWA 86206Lift And Trunnion Adapters to rear retainer at spools labeled − LPT WITHOUT SHAFT.

(7) Remove front PWA 85456 or PWA 85996 Retainer.

(8) Remove 23 nuts securing shaft to hub. Remove previously installed locator from tierod.

(9) Position PWA 85558 Adapter to rear face of shaft, and attach with eight screws.

(10) Install PWA 85333 Hydraulic Pusher to rear PWA 85331 Retainer and PWA 85558 Adapter. Attach PWA 29390 Hydraulic Pump to pusher.

(11) Optional, use Dry Ice P05−102 on the ID of the turbine rear hub to decrease the interference fit with the turbine shaft.

(12) Actuate hydraulic pump to remove shaft.

(13) Remove hydraulic pusher from handling fixture.

(14) Remove PWA 85558 Adapter from rear face of turbine shaft.

LOW PRESSURE TURBINE (LPT) − DISASSEMBLY−01

(15) Use PWA 29956 Handling EyeLifting Arm, PWA 85086 Lifting Arm, and PWA 85221 Lift And Trunnion Adapter in handling shaft. Optional PWA 85820 Storage Stand can be used to store shaft.

(16) Trunnion low pressure turbine to rear end down position onto two suitable pallets.

(17) Using suitable drift straighten tierod locks (504/1) and remove turbine tierods (504/2). Discard locks. See Figure 504.

LOW PRESSURE TURBINE (LPT) - DISASSEMBLY-02

Task 72-53-00-030-002:

1. Disassemble Low Pressure Turbine

A. Prerequisites

(1) Remove low pressure turbine external parts per Disassembly-01 Task 72-53-00-030-001.

B. Equipment And Materials Required

Special Tools:

PWA 28657	Sling, Strongback
PWA 29918	Stand, Build/Disassembly (Optional To PWA 87913)
PWA 85086	Arm, Lifting (2 Required)
PWA 85214	Adapter, Lifting
PWA 85215	Adapter, Lifting
PWA 85220	Adapter, Lift And Trunnion
PWA 85223	Pusher, Jackscrew
PWA 85224	Pusher, Jackscrew
PWA 85225	Puller, Jackscrew
PWA 85258	Puller, Jackscrew
PWA 85331	Retainer, Rear
PWA 85385	Support, Rear
PWA 85386	Support, Front
PWA 85392	Support, Front And Rear
PWA 85592	Eye, Lifting
PWA 85594	Adapter, Lift And Trunnion
PWA 85638	Fixture, Build (Optional to PWA 87097)
PWA 86081	Puller, Knocker
PWA 86206	Adapter, Lift And Trunnion (2 Required)
PWA 87097	Fixture, Build
PWA 87913	Stand, Build/Disassembly
PWA 88586	Puller, Hydraulic (Optional to PWA 85225)

C. Procedure

Subtask 72-53-00-030-051:

(1) Remove 3rd stage LPT airseal (501/1) using PWA 85258 Jackscrew Puller. See Figure 501.

(a) Remove two ball lock pins (501/5), loosen four screws (501/6) and retract puller plates (501/4). Rotate locking lugs (501/8) to face inward.

(b) Insert puller into airseal. Adjust screws (501/2) as required to seat ring (501/3) on ID flange of turbine rear hub. Rotate locking lugs (501/8) to position lug under rear face of hub flange.

(c) Extend puller plates (501/4) outward to position radius of puller plates against mating radius in upper ID of airseal. Reinstall two ball lock pins (501/5). Tighten four screws (501/6) to secure puller plates.

CAUTION: TIGHTEN THE SCREWS (501/2) IN SMALL INCREMENTS TO PREVENT DAMAGE TO THE NYLON PAD DETAILS OF THE SCREWS. IF THE SCREWS GO THROUGH THE PADS, THEY WILL DAMAGE THE AIRSEAL.

(d) Tighten the screws (501/2) to separate the airseal from the hub. Tighten the screws in small increments in a pattern sequence to prevent distortion of the airseal.

(e) Loosen knurled nuts (501/7) and rotate locking lugs (501/8) to face inward. Remove ball lock pins (501/5), loosen screws (501/6) and retract puller plates (501/4). Remove puller from airseal.

(f) Remove airseal from turbine rear hub and place in suitable protective container.

(2) Remove 39 bolts (502/1) securing the Stage 3 (inner) sealing ring assembly (502/3) and damper (502/2). Remove damper from sealing ring. Remove the three straight headed pins (502/4). See Figure 502.

(3) Using hoist, attach PWA 28657 Sling and two PWA 86206 Lift And Trunnion Adapters to rear retainer at spools labeled "LPT WITHOUT SHAFT". Lift assembly and trunnion to front end down position.

(4) Install LPT onto PWA 87097 or PWA 85638 Build Stand and PWA 29918 or PWA 87913 Stand. See Figure 503.

(a) Lower the LPT, front end downward, keep one to two inches (25.400 − 50.800 mm) of clearance between the front flange of the case and the fixture.

(b) Move the rest blocks (503/2) identified "assembly" under the third stage disk.

(c) Install the case to the fixture with 10 screws (503/3).

(d) Move the four clamps (503/1) identified "disassembly" over the third stage disk.

(5) Remove bolts securing retainer to flange of case. Remove retainer from LPT assembly. Loosen knobs clamping handling fixture. Remove PWA 85332 Handling Fixture or PWA 86026 Handling Fixture.

Subtask 72−53−00−030−052:

(6) Remove 6th stage turbine rotor assembly. See Figure 504.

(a) Remove any clip−on trim balance counterweights from the outer shroud of the 6th stage LPT blades. Discard the counterweights.

(b) Remove 40 nuts (504/1) and spacers (504/2), and counterweights as applicable, securing front flange of 6th stage disk to turbine rear hub.

(c) Position contoured block of PWA 85223 Jackscrew Pusher against 6th stage disk web and stepped block against lip of turbine hub bore. Using wrench, hold block at flat surfaces of shaft detail while turning nut with second wrench to separate disk from hub. Remove pusher.

(d) Secure PWA 85592 Eye to bore of 6th stage LPT disk with lifting eye side up.

(e) Attach hoist to PWA 85592 Lifting Eye. Lift rotor assembly and position disk, front end down on PWA 85386 Support. Remove hoist and eye.

(7) Remove 12 screws (505/2) securing 6th stage LPT air sealing ring segments (505/3) to rear turbine case. Remove ring segments from case. See Figure 505.

Subtask 72−53−00−030−053:

(8) Remove 6th stage vane clusters (506/2) from rear turbine case. See Figure 506.

(a) Remove 36 vane clusters from turbine case.

(b) Remove four turbine case heat shields (506/1) from turbine case, which are installed just above the 5th stage turbine rotor (506/3).

Subtask 72−53−00−030−054:

(9) Remove 5th stage turbine rotor assembly using PWA 85225 Jackscrew Puller. See Figure 507 (Sheet 1).

(a) Slide the two rod details of the puller towards the center of the channel. Turn the feet towards the center of the channel.

(b) Position the puller onto the rear flange of the turbine case, and two rod details located in the bore of the turbine hub. Align the boltholes and attach the channel to the case flange with workbolts and nuts.

(c) Turn the feet and slide rods outward to position the feet under the turbine hub bore. The dowel pins in the rod detail should point radially outward.

(d) Hold the dowel pins and tighten the jamnuts evenly to remove the 5th stage rotor assembly.

(e) Attach the PWA 85594 Adapter to bore of turbine rear hub with lifting eye side upward.

(f) Connect hoist with PWA 85086 Arm to lifting eye of the adapter. Using hoist, lift rotor assembly and attach PWA 85592 Eye to front (lower) ID bore of hub with lifting eye side downward. Using second hoist, connect PWA 85086 Arm to lifting eye of lower adapter.

(g) Using both hoists, lift and trunnion rotor assembly to rear end down position. Remove lower hoist, arm and adapter. Lower assembly onto suitable support. Remove hoist, arm and adapter.

(10) Remove 5th stage turbine rotor assembly using PWA 88586 Hydraulic Puller (Optional to PWA 85225). See Figure 507 (Sheet 2).

NOTE: The "I" beam fits on the "LPT CASE REAR" side only. See the metal stamped notes on the "I" beam to make sure the tool is installed correctly.

(a) If necessary, put the hydraulic cylinder to the side of the detail−1 base assembly that is stamped "LPT CASE REAR". Install the detail rod and puller through the base assembly and the hydraulic cylinder and attach with the spacer and jamnut.

(b) Attach an applicable sling and hoist to the lift eyes of the base assembly and lift the PWA 88586 Hydraulic Puller. Turn the detail−10 puller jaw radially inward.

(c) Lower the puller to the rear face of the LPT rear case. Turn the detail−10 puller jaw radially outward under the flange of the 5th stage hub and blade assembly.

(d) Attach the hose of a hydraulic pump to the hydraulic cylinder.

(e) Actuate the hydraulic cylinder and begin to disengage the hub and blade assembly.

(f) Release the hydraulic pressure and rotate the puller on the LPT rear case. Repeat the procedure as necessary until the 5th stage hub and blade assembly disengages from the 4th stage disk.

(g) Attach the PWA 85594 Adapter to bore of turbine rear hub with lifting eye side upward.

(h) Connect hoist with PWA 85086 Arm to lifting eye of the adapter. Using hoist, lift rotor assembly and attach PWA 85592 Eye to front (lower) ID bore of hub with lifting eye side downward. Using second hoist, connect PWA 85086 Arm to lifting eye of lower adapter.

(i) Using both hoists, lift and trunnion rotor assembly to rear end down position. Remove lower hoist, arm and adapter. Lower assembly onto suitable support. Remove hoist, arm and adapter.

(11) Remove (13) 5th stage LPT air sealing ring segments (508/1) from groove in rear turbine case. See Figure 508.

(12) Remove four turbine case heat shields (508/2) from rear turbine case.

Subtask 72−53−00−030−055:

(13) Remove 5th stage vane clusters (509/1) from rear turbine case. See Figure 509.

(a) Remove 38 vane clusters from turbine case.

(b) Remove four turbine case heat shields (509/2) from turbine case, which are installed just above 4th stage turbine rotor (509/3).

Subtask 72−53−00−030−056:

(14) Remove 4th stage turbine rotor assembly. See Figure 510.

(a) Remove 40 nuts (510/1) and washers (510/3) securing front flange of 4th stage LPT disk (510/2) to 3rd stage LPT disk (510/4).

(b) Position pusher (511/5) of PWA 85224 Jackscrew Pusher against web of 3rd stage disk (511/6) and locator (511/2) against web and bore of 4th stage LPT disk (511/1). See Figure 511.

(c) While holding locator (511/2) at wrench flats (511/3) on shaft, turn nut (511/4) to separate disks. Remove pusher.

(15) Install 4th stage rotor assembly on PWA 85392 Support.

(a) Align boltholes in base with tierods and position PWA 85215 Lifting Adapter onto rear flange of 4th stage LPT disk. Install four detail hand knobs to tierods to secure adapter to disk.

LOW PRESSURE TURBINE (LPT) − DISASSEMBLY−02

(b) Connect hoist to lifting eye of adapter. Using hoist position rotor assembly, front end down, on PWA 85392 Support.

(16) Remove (11) (Pre SB PW4ENG 72−41) or (22) (Post SB PW4ENG 72−41) 4th stage LPT air sealing ring segments (512/1) from turbine case. See Figure 512.

(17) Remove four turbine case heat shields (512/2) from turbine case.

Subtask 72−53−00−030−057:

(18) Remove 4th stage vane clusters (513/3). See Figure 513.

(a) Remove 44 vane clusters from turbine case.

(b) Remove the four heat shields (513/1) installed on case rail.

(c) Remove four turbine case heat shields (513/2) from turbine case, which are installed just above the 3rd stage turbine rotor.

Subtask 72−53−00−030−058:

(19) Remove 3rd stage turbine rotor assembly.

(a) Remove four clamps from third stage disk.

(b) Align boltholes in base with tierods and position PWA 85215 Adapter onto rear of 3rd stage LPT disk with lifting eye side up. Secure adapter to disk with four detail hand knobs.

(c) Connect hoist with PWA 85086 Arm to lifting eye of adapter. Using hoist, lift rotor assembly and secure PWA 85214 Adapter to bore of disk with lifting eye side down. Using second hoist, connect PWA 85086 Arm to lifting eye of lower adapter.

(d) Using both hoists, lift and trunnion rotor to rear end down position. Remove lower hoist, arm and adapter. Lower disk onto PWA 85385 Support. Remove hoist, arm and adapter.

(20) Remove (13) (Pre SB PW4ENG 72−41) or (26) (Post SB PW4ENG 72−41) 3rd stage LPT air sealing ring segments (514/1) from turbine case. See Figure 514.

(21) Remove four turbine case heat shields (514/2) from turbine case.

Subtask 72−53−00−030−059:

(22) Remove 3rd stage LPT vane clusters (515/3). See Figure 515.

- (a) Remove 39 nuts (515/2) which secure inner lugs of 3rd stage LPT vane clusters (515/3) to 3rd stage LPT duct assembly studs (515/4).
- (b) Remove (39) 3rd stage vane clusters from turbine case. Remove seals (515/7), (515/8) and (515/9) from seal grooves in platform and feet of vanes.
- (c) Remove 3rd stage LPT duct (515/1) from turbine case.

(23) Remove 3rd stage LPT sealing ring support (515/5), duct assembly, from build fixture (515/6).

(24) Remove 3rd stage LPT duct from sealing ring support.

Subtask 72−53−00−030−060:

(25) Remove (12) 3rd stage LPT duct segments (516/2) from turbine case. Remove 3rd stage LPT duct seals (516/1) from grooves in duct segments. See Figure 516.

(26) Remove instrumentation boss plug (517/5) from instrumentation boss hole (517/4) in turbine case. If necessary, use PWA 86081 Puller to remove plug. See Figure 517.

(27) Remove 3rd stage LPT duct (517/1) from turbine case.

(28) Attach PWA 85220 Adapter to rear flange of turbine rear case.

- (a) Retract four quick release pins from boltholes in base of adapter.
- (b) Connect hoist to lifting eye in center of adapter base.

(c) Using hoist, position outer curved groove in base over rear flange of case. Align boltholes and secure adapter to case with four quick release pins.

(29) Remove ten screws securing front flange of turbine case to fixture.

(30) Using hoist, place case, front end down, on pallet. Remove hoist and adapter.

Subtask 72−53−00−030−061:

(31) Remove two bolts (518/1) and nuts (518/3) securing identification plate (518/2) to bracket on front (lower) flange of turbine rear case. Keep identification plate with low pressure turbine. See Figure 518.

LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-01

Task 72-53-00-990-004:

1. General Inspection Requirements - Low Pressure Turbine (LPT)

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/ subassemblies are provided in individual Inspection/ Check sections. Application of each inspection function is shown in Inspection/Check-00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check-00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check-01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check-02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/ subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−53−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−53−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

  (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

  (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

LOW PRESSURE TURBINE - INSPECTION/CHECK-03

Task 72-53-00-990-005:

1. Visual Inspection - Low Pressure Turbine (LPT)
   A. For inspection requirements applicable to installed (accessible) parts of low pressure turbine (LPT) see 72-00-53, Inspection/Check-XX (Task 72-00-53-220-XXX).

Previous Pageblock Return to Previous Menu Next Pageblock

LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-04

Task 72-53-00-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

Task 72-53-00-400-001:

1. Assemble Low Pressure Turbine

A. Prerequisites

(1) See Inspection/Check-04 Task 72-53-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble 3rd stage turbine rotor assembly per 72-53-03, Assembly-01 Task 72-53-03-440-001.

(3) Assemble 4th stage turbine rotor assembly per 72-53-04, Assembly-01 Task 72-53-04-440-001.

(4) Assemble 5th stage turbine rotor assembly per 72-53-05, Assembly-01 Task 72-53-05-440-001.

(5) Assemble 6th stage turbine rotor assembly per 72-53-06, Assembly-01 Task 72-53-06-440-001.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun, Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 29754	Control, Heater
PWA 29918	Stand, Build/Disassembly (Optional To PWA 87913)
PWA 85086	Arm, Trunnion (2 Required)
PWA 85214	Adapter, Lifting
PWA 85215	Adapter, Lifting
PWA 85220	Adapter
PWA 85231	Fixture, Angle Of Turn
PWA 85232	Fixture, Angle Of Turn

Special Tools:

(CONTINUED)

PWA 85235	Retainer, Airseal (Set)
PWA 85236	Retainer, Airseal (Set)
PWA 85237	Retainer, Airseal (Set)
PWA 85239	Protector, Plastic
PWA 85318	Heater, Electrical
PWA 85563	Heater, Electrical
PWA 85592	Eye, Lift
PWA 85594	Adapter, Lift And Trunnion
PWA 85607	Retainer, Duct Segment (12 Required)
PWA 85638	Fixture, Build (Optional to PWA 87097)
PWA 85704	Pusher, Installation
PWA 86216	Pin, Alignment
PWA 87004	Retainer, Clamping
PWA 87097	Fixture, Build
PWA 87913	Stand, Build/Disassembly

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−102	Ice, Dry
P05−395	Beeswax
P05−396	Paraffin Wax Blend
P06−023	Lubricant

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock, Turbine Tierod	40	72−53−00/3/560
Lock, Turbine Blade	128	72−53−00/6/80

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Electric Flameless Heat Gun, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

Subtask 72−53−00−430−051:

(1) Put PWA 87097 Build Fixture or PWA 85638 Build Fixture on PWA 29918 Stand or PWA 87913 Stand, using sui sling and hoist. Attach the fixture to the stand with the detail washers and cap screws.

(2) Attach PWA 85220 Adapter to rear flange of turbine rear case.

(a) Retract four quick release pins from boltholes in base of adapter.

(b) Connect hoist to lifting eye in center of adapter base.

(c) Using hoist, position outer curved groove in base over rear flange of case. Align boltholes and secure adapter to case with four quick release pins.

(3) Remove four blocks (1001/5) and lower hand knobs of PWA 87097 Build Stand or PWA 85638 Build Stand.

(4) Using hoist and PWA 85220 Adapter, align boltholes and position turbine rear case (1001/4), smaller flange end down, onto PWA 87097 Fixture or PWA 85638 Fixture. Secure case to fixture with 10 detail washers and screws. See Figure 1001.

(5) Install 3rd stage LPT duct (1001/1) into turbine rear case, aligning instrumentation boss hole (1001/2) in duct with mating hole (1001/3) in turbine case. Use PWA 86216 Alignment Pin to align the two respective holes.

(6) Install 3rd stage LPT duct segments into turbine rear case. See Figure 1002.

CAUTION: THIRD STAGE LPT DUCT SEGMENTS MUST BE INSTALLED IN SETS.

(a) Install 3rd stage LPT duct seals (1002/1) into seal slots between adjacent duct segments. Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain seals in position.

(b) Install (13) 3rd stage LPT duct segments (1002/2) into turbine case, inserting locating pins into locating pin slots in fixture. Install duct segment with instrumentation hole at location of mating instrumentation hole in turbine case. Use PWA 86216 Alignment Pin to align the three respective holes.

(c) Hold duct segments against turbine case wall and install PWA 85607 Retainer over each segment and into groove in case. Remove the PWA 86216 Alignment Pin from the case.

(7) Install instrumentation (borescope) boss plug and related details.

NOTE: When plug, spring tension washer and stop are properly assembled and installed to turbine case, plug should be loaded inward, by spring washer, to seat in case boss.

(a) Place spring tension washer (1002/4) into recess of instrumentation plug stop (1002/5); so that OD of washer contacts stop and conical surface of washer tapers away from stop toward center.

(b) Insert instrumentation boss plug (1002/7) into stop and washer from washer side.

(c) Secure plug to stop with cotter pin (1002/8).

(d) Install gasket (1002/3) onto plug so that split will face inward.

(e) Install instrumentation plug stop (cover).

1 For engines incorporating the intent of SB PW4ENG 72−194, which have the new silver plated bolts (MS9715−06), install bolts (1002/6) with no lubricant. Secure plug, stop, washer, and gasket to instrumentation boss on case with two bolts. Torque bolts to 75 −85 lb−in. (8.474 − 9.604 N.m).

2 For engines incorporating the intent of SB PW4ENG 72−194, but which have used bolts, and engines not incorporating the intent of SB PW4ENG 72−194, apply Lubricant P06−023 to bolts (1002/6). Secure plug, stop, washer, and gasket to instrumentation boss on case with (two) bolts. Torque bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m).

(f) Lockwire bolts securing plug to case.

(8) Assemble 3rd stage LPT duct onto 3rd stage LPT sealing ring support. See Figure 1003.

(a) Position sealing ring support (1003/3), with smaller OD end down, on workbench.

(b) Align boltholes and position duct (1003/2) onto support.

(c) Install several equally spaced .190−32 workbolts (1003/1) to secure duct assembly to sealing ring support. Tighten bolts to secure parts.

(9) Using hoist and suitable sling, lift and trunnion duct and support assembly to front end, smaller OD, down position.

(10) Position the 3rd stage LPT duct (1004/1) assembly into turbine rear case (1004/2) and seat on fixture supports (1004/5). Adjust hand knobs (1004/4) as required to support duct. See Figure 1004.

(11) Install four blocks (1004/3), that are marked "ASSEMBLY", to the fixture. Use two detail bolts to hold each block.

(12) Install 3rd stage LPT duct (1005/1), smaller ID end down, into 3rd stage vane foot groove in ID flange of turbine case. See Figure 1005.

(13) Install 39 each of 3rd stage LPT seal (1005/8) and (1005/9) into seal slots between adjacent vanes (1005/3). Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain seals in position.

NOTE: Vane clusters with thicker anti−rotation locks (Post SB PW4ENG 72−473) can only be used in low pressure turbine cases with deeper anti−rotation lock slots (Post SB PW4ENG 72−473). Vane clusters with thinner locks (Pre SB PW4ENG 72−473) can be physically put into the LPT case (Post SB PW4ENG 72−473). If you do this you could have a loss of performance due to leakage around the vane locks.

(14) Install 39 3rd stage LPT seals (1005/7) into seal slots between adjacent vanes. Seals are only required at locations where adjacent vane clusters both have mating seal slot. Use Beeswax P05−395 or Paraffin Wax Blend P05−396, as required to retain seals in position.

(15) Install PWA 85704 Installation Pusher, if necessary. See Figure 1006.

(16) Align bolthole in lug of vane cluster with stud (1005/4) in rear flange of duct assembly. Position front foot of vane cluster into groove in ID of turbine case. Install remaining 38 vanes. Adjust hand knobs (1005/6) to locate feet of vanes on duct (1005/5). Seat vanes in turbine case groove using PWA 85704 Installation Pusher and mallet. Remove airseal retainers as necessary.

(17) Install 39 nuts (1005/2) lubricated with Engine Oil P03−001, onto studs (1005/4). Ensure that vane clusters are properly engaged on studs (1005/4) and seated on duct (1005/5). Torque nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

Subtask 72−53−00−430−053:

(18) Install four turbine case heat shields (1007/2) into ID of turbine case just rearward of 3rd stage vanes. Insert front flange, smaller radius, of heat shield into groove in ID flange of turbine case. See Figure 1007.

NOTE: Install the initial heat shield at the 6 o'clock position. The heat shield must be new or not damaged. The three heat shields remaining must be in serviceable limits. See the applicable Inspection/Check in PW4000 Series CIR, PN 51A357.

(19) Install (26) 3rd stage LPT air sealing ring segments (1007/1) over heat shields. Insert tabs at front of ring segments into groove in ID of turbine case. Engage vane cluster lugs into segment holes. Hole ring segment against turbine case wall. Install one PWA 85235 Retainer over each ring segment and into groove in turbine case. Make sure you hang the streamer loose end out of the turbine case.

NOTE: Make distance between end of airsealing ring segments and heat shield one inch (25.400 mm) minimum at four places.

(20) Install 3rd stage turbine rotor assembly into build fixture. See Figure 1008.

(a) Secure PWA 85214 Adapter to bore of disk with lifting eye side up. Connect hoist with PWA 85086 Arm to lifting eye of adapter.

(b) Using hoist, lift rotor assembly. Align boltholes and position PWA 85215 Adapter to lower (rear) side of disk with lifting eye side down. Install four hand knobs to tierods to secure disk.

(c) Connect second hoist and PWA 85086 Arm to lifting eye of PWA 85215 Adapter. Using both hoists, lift and trunnion rotor to front end down position. Remove lower hoist, arm and adapter.

(d) Lower disk (1008/1) into turbine case. Pilot disk bore on outer face of towers (1008/2) and seat tierod heads on support face of blocks (1008/3).

(e) Remove hoist, arm and adapter.

Subtask 72−53−00−430−054:

(21) Install four turbine case heat shields (1009/2) into ID of turbine case just rearward of 3rd stage turbine rotor blades. Insert front flange smaller radius, of heat shield into groove in ID flange of turbine case. Install four turbine case heat shield ring segments (1009/1) onto ID flange of case. See Figure 1009.

(22) Install (44) 4th stage LPT vane clusters (1009/3) into turbine case. Align slot in rear foot of vane clusters with slots in turbine case ID flange. Insert front foot of vane clusters into groove in turbine case. Seat vanes in turbine case groove using PWA 85704 Installation Pusher and mallet. Remove airseal retainers as necessary.

NOTE: Vane clusters with thicker anti−rotation locks (Post SB PW4ENG 72−473) can only be used in low pressure turbine cases with deeper anti−rotation lock slots (Post SB PW4ENG 72−473). Vane clusters with thinner locks (Pre SB PW4ENG 72−473) can be physically put into the LPT case (Post SB PW4ENG 72−473). If you do this you could have a loss of performance due to leakage around the vane locks.

Subtask 72−53−00−430−055:

(23) Install four turbine case heat shields (1010/2) into ID of turbine case just rearward of 4th stage LPT vanes (1010/3). Insert front flange, smaller radius, of heat shield into groove in ID flange of turbine case. See Figure 1010.

NOTE: Install the initial heat shield at the 6 o'clock position. The heat shield must be new or not damaged. The three heat shields remaining must be in serviceable limits. See the applicable Inspection/Check in PW4000 Series CIR, PN 51A357.

(24) Install (22) 4th stage LPT air sealing ring segments (1010/1) into groove in ID flange of turbine case. Engage vane cluster lugs into segment holes. Hold ring segment against turbine case wall. Install one PWA 85236 Retainer over each ring segment and into groove

in turbine case. Make sure you hang the streamer loose end out of the turbine case.

NOTE: Make distance between end of airsealing ring segments and heat shield one inch (25.400 mm) minimum at four places.

(25) Optional, position disk onto PWA 85318 Heater.

NOTE: You can use the optional flameless torch or flame torch as previously specified to heat the disk flange.

(a) If disk is stored front end, smaller ID, end down, attach PWA 85594 Fixture. Using hoist lift assembly and position disk onto heater.

(b) If disk is stored rear end larger ID, down, attach PWA 85215 Adapter and PWA 85594 Adapter with two PWA 85086 Trunnion Arms. Using hoist lift and trunnion assembly to front end down position. Lower disk onto heater. Attach power supply of PWA 29754 Heater Control to junction box on heater. Attach thermocouple connector to cable assembly of heater control. Ensure that thermocouple probe contacts disk flange.

(26) Position four PWA 87004 Retainers equally spaced around the 4th stage LPT disk. Install the arm detail of the retainer between the blades and attach the hook end to the rear of the 4th stage LPT airseal (1011/8). Tighten the thumbscrew to hold the retainer in position. See Figure 1011.

CAUTION: TEMPERATURE OF DISK MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO PARTS MAY OCCUR.

(27) Use the PWA 85318 Heater, or the optional flameless torch or flame torch, to heat the front (Smaller ID) flange of the disk. Heat the disk to obtain a minimum temperature difference of 250°F (138.8°C) between mating parts.

(28) Position rotor assembly over 3rd stage LPT disk. Vector stack 4th stage rotor by placing unbalance symbol (triangle) on 4th stage LPT disk 180 degrees from unbalance symbol (triangle) on 3rd stage LPT disk. Align boltholes in disk with tierods (1011/6) in 3rd stage LPT disk and lower assembly onto 3rd stage LPT disk. Remove hoist and fixture.

(29) Install 40 washers (1011/3) onto tierods.

(30) Install 40 nuts (1011/2), lubricated with Engine Oil P03−001, to tierods.

(31) Install PWA 85231 Angle−Of−Turn Fixture to 4th stage LPT disk. See Figure 1012.

(a) Loosen four clamps (1012/1).

(b) Align bushings (1012/5) with (tierod) nuts (1012/10) and plate (1012/4), stamped markings up, over rear flange of 4th stage LPT disk (1012/2). Secure with four clamps (1012/1).

(c) Place temporary index mark on plate (1012/4) and 4th stage disk.

(d) Locate torque sequence numbers (1012/8) on plate. Pilot wrench (1012/3) into bushing (1012/5) at torque sequence No. 1 and insert socket (1012/11) over (tierod) nut (1012/10).

(32) (Reference 1250) Torque the tierod nuts with the use of a 0.500 inch (12.700 mm) square drive torque wrench installed in PWA 85231 Fixture.

(a) Apply initial torque of 140 − 160 lb−in. (15.818 − 18.078 N.m) to each nut in numerical sequence per torque sequence numbers (1012/8) stamped on plate.

CAUTION: THE FOLLOWING TORQUING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN MATING PARTS.

(b) With a maximum temperature differential of 40°F (22.2°C) between the mating parts, loosen one pair of nuts.

(c) Measure the torque necessary to turn the nut. If the measured torque is less than 50 lb-in. (5.649 N.m), then tighten to a torque of 45 lb-in. (5.084 N.m) plus or minus 5 lb-in. (0.565 N.m) and continue with step (e).

(d) If the measured torque is more than 50 lb-in. (5.649 N.m), find the torque necessary to turn the nut, add 15 lb-in. (1.695 N.m) plus or minus 5 lb-in. (0.565 N.m) to this torque and tighten the nut using the total torque. Total torque cannot exceed 100 lb-in. (11.298 N.m).

(e) Set indicator dial (1012/9) to zero with index mark (1012/7) on fixture plate (1012/4). Tighten thumbscrew (1012/6) to set the indicator dial. Apply 57 - 61 degree angle of turn.

(f) Do the torque procedure again, steps (b) through (e), as applicable on all the tierod nuts. Use the torque sequence numbers (1012/8) stamped on the fixture.

(g) Remove the wrenches (1012/3). Loosen the four clamps (1012/1). Remove the plate (1012/4) from 4th stage disk.

(33) Remove the four PWA 87004 Retainers.

Subtask 72-53-00-430-056:

(34) Install four turbine case heat shields (1013/2) into ID of turbine case above 4th stage LPT blades (1013/3). See Figure 1013.

(35) Install (38) 5th stage LPT vane clusters (1013/1) into turbine case. Align slots in rear foot of vane clusters with slots in turbine case ID flange. Insert front foot of vane clusters into groove in turbine case. Seat vanes in turbine case groove using PWA 85704 Installation Pusher and mallet. Remove airseal retainers as necessary.

NOTE: Vane clusters with thicker anti-rotation locks (Post SB PW4ENG 72-473) can only be used in low pressure turbine cases with deeper anti-rotation lock slots (Post SB PW4ENG 72-473). Vane clusters with thinner locks (Pre SB PW4ENG 72-473) can be physically put into the LPT case

(Post SB PW4ENG 72-473). If you do this you could have a loss of performance due to leakage around the vane locks.

Subtask 72-53-00-430-057:

(36) Install four turbine case heat shields (1014/2) into ID of turbine case rearward of 5th stage LPT vanes. Insert front flange, smaller radius of heat shield into groove of turbine case. See Figure 1014.

NOTE: Install the initial heat shield at the 6 o'clock position. The heat shield must be new or not damaged. The three heat shields remaining must be in serviceable limits. See the applicable Inspection/Check in PW4000 Series CIR, PN 51A357.

(37) Install (19) 5th stage LPT air sealing ring segments (1014/1) over heat shields and insert lugs at front of ring segments into groove in ID of turbine case. Engage vane cluster lugs into segment holes. Hold ring segment against turbine case wall. Install one PWA 85237 Retainer over each ring segment and into groove in turbine case. Make sure you hang the streamer loose end out of the turbine case.

(38) Optional, position PWA 85563 Heater onto rear flange of 4th stage LPT disk. Attach power supply of PWA 29754 Heater Control to junction box on heater. Attach thermocouple connector to cable assembly of heater control. Ensure that thermocouple probe contacts disk flange.

NOTE: You can use the optional flameless torch or flame torch as previously specified to heat the disk flange.

CAUTION: TEMPERATURE OF DISK MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO PARTS MAY OCCUR.

(39) Use the PWA 85563 Heater, or the optional flameless torch or flame torch, to heat the rear flange of the 4th stage disk. Heat the disk to obtain a minimum temperature difference of 250°F (138.8°C) between mating parts.

(40) Using hoist, position PWA 85594 Trunnion Adapter and PWA 85592 Lift Eye with two PWA 85086 Trunnion Arms onto turbine rear hub. Trunnion rotor assembly to front (hub), end down position.

(41) Using hoist, position 5th stage rotor assembly over 4th stage LPT disk. Vector stack 5th stage rotor assembly by placing axial runout symbol (1015/2) on turbine rear hub (1015/1) 180 degrees from axial runout symbol (1015/7) on 4th stage LPT disk (1015/6). Align boltholes in disk with tierods (1015/5) in 4th stage LPT disk. Lower assembly onto disk. Seat disk. Remove hoist and fixture. See Figure 1015.

Subtask 72-53-00-430-058:

(42) Install four turbine case heat shields (1016/1) into ID of turbine case rearward of 5th stage LPT rotor (1016/3). See Figure 1016.

(43) Install (36) 6th stage LPT vane clusters (1016/2) into turbine case. Align slot in rear foot of vane cluster with slot in turbine case flange. Insert foot of vane cluster into groove in ID of turbine case. Seat vanes in turbine case groove using PWA 85704 Installation Pusher and mallet. Remove airseal retainers as necessary.

NOTE: Vane clusters with thicker anti-rotation locks (Post SB PW4ENG 72-473) can only be used in low pressure turbine cases with deeper anti-rotation lock slots (Post SB PW4ENG 72-473). Vane clusters with thinner locks (Pre SB PW4ENG 72-473) can be physically put into the LPT case (Post SB PW4ENG 72-473). If you do this you could have a loss of performance due to leakage around the vane locks.

(44) Remove installation pusher.

Subtask 72-53-00-430-059:

R (45) Install the 6th stage air seal segment (1017/3) to the
R case as follows: See Figure 1017.

R (a) Lightly apply Engine Oil P03-001 to the threads of
R the 12 screws (1017/1).

R (b) Install the air seal segments (1017/3) to case, engage the vane cluster lugs into the segment holes and install with (12) 6th stage LPT air sealing ring flanges (1017/2), with the ends staggered.

R NOTE: Pre and Post SB PW4ENG 72-769 6th stage air seal segments are interchangeable in full sets with the following exception. Old "rubbed-in" air sealing ring segment assemblies and new are interchangeable.

R NOTE: Old seal assemblies that are not "rubbed-in" can not be intermixed with new air sealing ring segment assemblies introduced by SB PW4ENG 72-769.

R (c) Secure the flanges to the case with (12) screws (1017/1), at the countersunk hole locations.

R (d) Secure the flanges to the case with (12) screws (1017/1), at the countersunk hole locations.

R (e) Torque the screws to 22 - 36 lb-in. (2.486 - 4.067 N.m).

(46) Cool the front flange of the 6th stage LPT disk with Dry Ice P05-102.

(47) Attach PWA 85592 Lifting Adapter to 6th stage turbine rotor.

(a) Loosen hand knobs and slide clamp details toward center of adapter.

(b) Position base, stepped side up, through 6th stage disk bore. Raise base and seat against front face of disk bore. Slide clamps outward to seat against disk bore and tighten hand knobs to secure adapter to disk.

(48) Attach hoist to lifting eye on adapter. Using hoist, position 6th stage LPT disk (1018/2) over turbine rear hub (1018/5).

CAUTION: MAKE SURE THAT EIGHT 6TH STAGE LPT SEALS ARE INSTALLED ON THE FRONT FLANGE OF THE 6TH STAGE LPT DISK. OPERATION OF THE ENGINE WITHOUT THE SEALS INSTALLED WILL CAUSE VERY HIGH TEMPERATURES WHICH CAN DECREASE THE DISK LIFE.

(49) Vector stack 6th stage rotor assembly onto turbine rear hub with axial runout symbols (dot within circle) 180 degrees apart. Align boltholes and seat disk onto hub. Remove hoist and lifting adapter. See Figure 1018.

(50) Remove hoist and trunnion adapter.

(51) Lubricate threads of 40 tierods (1018/6) and washer face of nuts (1018/1) with Engine Oil P03−001. Omit lubrication of disk surface.

(52) Install 40 spacers (1019/3) and nuts (1019/1) onto tierods.

(53) Install PWA 85232 Angle−Of−Turn Fixture onto 6th stage turbine disk. See Figure 1019.

  (a) Aligning bushings (1019/6) with nuts (1019/11) and position plate (1019/4), stamped markings up, over 6th stage LPT disk (1019/3).

  (b) Place temporary index marks on plate (1019/4) and 6th stage disk.

  (c) Locate torque sequence numbers (1019/8) on plate. Pilot wrench (1019/1) into bushing (1019/6) at location No. 1 and install socket (1019/10) onto nut (1019/5).

  (d) (Reference 1251, 1252, or 1253) Torque nuts using 0.500 inch square drive torque wrench installed in PWA 85232 Fixture.

    1 Apply initial torque of 140 − 160 lb−in. (15.818 − 18.078 N.m) to each nut in numerical sequence per torque sequence numbers (1019/8) stamped on plate.

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-01

CAUTION: THE FOLLOWING TORQUING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN MATING PARTS.

2 Loosen the nuts in pairs.

3 Measure the torque necessary to turn the nut. If the measured torque is less than 50 lb-in. (5.469 N.m), then tighten to a torque of 45 lb-in. (5.084 N.m) plus or minus 5 lb-in. (0.565 N.m) and continue with the angle of turn.

4 If the measured torque is more than 50 lb-in. (5.649 N.m), find the torque necessary to turn the nut, add 15 lb-in. (1.695 N.m) plus or minus 5 lb-in. (0.565 N.m) to this torque. The total torque cannot be more than 100 lb-in. (11.298 N.m).

5 Apply the final angle of turn:

a (Reference 1251) (Pre SB PW4ENG 72-256) For engines with the 5th stage turbine hub PN 50N405, set the indicator dial (1019/9) to zero with the index mark (1019/7) on the fixture plate. Tighten the thumbscrew (1019/5) to set the indicator dial. Apply a 62 - 66 degree angle of turn.

b (Reference 1252) (Post SB PW4ENG 72-256) For engines with 5th stage turbine hub PN 50N505, set the indicator dial (1019/9) to zero, with with the index mark (1019/7) on the fixture plate. Tighten the thumbscrew (1019/5) to set the indicator dial. Apply a 64 - 68 degree angle of turn.

c (Reference 1253) For engines with 5th stage turbine hub PN 51N305 and subsequent, set the indicator dial (1019/9) to zero, with the index mark (1019/7) on the fixture plate. Tighten the thumbscrew (1019/5) to set the indicator dial. Apply a 52 - 56 degree angle of turn.

NOTE: Use Reference 1253 for Phase-3 engines as built by P&W that have

R
R

5th stage turbine hub PN 51N305 and subsequent.

6 Do this torque procedure, steps 2 through 5, again as applicable on all tierod nuts. Use the torque sequence numbers stamped on the fixture.

(e) Remove the angle of turn fixture.

(54) Position PWA 85239 Protector over rear flange of turbine case.

E. Postrequisites

(1) Prepare low pressure turbine for balancing per Assembly−02 (Task 72−53−00−400−002).

(2) Balance low pressure turbine per Assembly−03 (Task 72−53−00−400−003).

(3) Final assemble low pressure turbine per Assembly−04 (Task 72−53−00−400−004).

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-02

Task 72-53-00-400-002:

1. Prepare Low Pressure Turbine For Balancing
   A. Prerequisites
      (1) See Inspection/Check-04 (Task 72-53-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.
      (2) Assemble low pressure turbine per Assembly-01 (Task 72-53-00-400-001).
   B. Equipment And Materials Required

      Special Tools:
      PWA 28657 Sling
      PWA 29390 Hydraulic Pump
      PWA 29918 Stand, Build/Disassembly (Optional To PWA 87913)
      PWA 85205 Front Balance Fixture
      PWA 85331 Rear Retainer
      PWA 85332 Handling Fixture (Optional To PWA 86026)
      PWA 85333 Pusher/Puller
      PWA 85457 Balance Arbor
      PWA 85640 Adapter
      PWA 85766 Rear Balance Fixture
      PWA 86026 Handling Fixture (Optional To PWA 85332)
      PWA 86206 Adapter, Lift And Trunnion (2 Required)
      PWA 87913 Stand, Build/Disassembly

   C. Procedure

   Subtask 72-53-00-430-060:
      (1) Install PWA 85205 Front Balance Fixture onto PWA 29918 or PWA 87913 Stand, so that OD snap on fixture engages stand. See Figure 1001.
      (2) If present, remove Protector (PWA 85239) from rear flange of turbine case.
      (3) Install PWA 85457 Balance Arbor to Front Balance Fixture (PWA 85205).
         (a) Install detail lift eyes, as necessary.
         (b) Position arbor in fixture with guide pin facing up.
         (c) Secure arbor to fixture with six bearing clamps.
      (4) Install PWA 85640 Adapter to rear face of arbor with four detail bolts.
      (5) Install handling fixture. See Figure 1002.
         (a) Install PWA 85332 (Optional to PWA 86026) Handling Fixture.
            1 Position handling fixture using suitable tooling, while locator is installed in one tierod hole to align module with fixture.

Figure 1002
(Task 72-53-00-400-002)

      2 Slide lockring rearward using two detail T-handle rods, to expand clamps. Secure lockring with four screws, so that clamps interface with turbine rear hub bore.
   (b) Install PWA 86026 Handling Fixture (Optional to PWA 85332).
      1 Install locator (detail-8) onto tierod where tierod nut has been removed.
      2 Measure 5th stage hub flange with template (detail-18). If flange thickness is approximately 0.680 inch (17.272 mm), then install spacer (detail-17). If flange thickness is approximately 0.813 inch (20.650 mm), then spacer is not used.
      3 Position handling fixture using PWA 85635 Lift Adapter, while locator is installed on one tierod. Locator aligns LPT with fixture.
      4 Tighten four hex head bolts to engage supports and arms into 5th stage hub.

(6) Install PWA 85331 Rear Retainer.
   (a) Lift retainer using two .500-13 lift holes marked FOR LIFTING TOOL VERTICAL ONLY.
   (b) Position retainer over previously installed handling fixture and secure to case with 48 screws and washers.
   (c) Lock axial position of LPT rotor by tightening eight hand knobs against handling fixture.

(7) Use a hoist to attach PWA 28657 Sling and two PWA 86206 Lift And Trunnion Adapters to rear retainer at spools labeled LPT WITHOUT SHAFT.

(8) Remove the bolts and washers that hold the turbine rear case (front flange) to the build fixture.

(9) Carefully lift the assembly 1.0 - 2.0 inches (25. - 51. mm). Remove the bolts and four blocks from the fixture immediately below the 3rd stage LPT disk.

(10) Lift the assembly from the stand.

(11) Lower the LPT module over the arbor.

(12) Install PWA 85333 Pusher/Puller. See Figure 1003.
   (a) Attach PWA 29390 Hydraulic Pump.
   (b) Actuate (to extend) cylinder and thread into Adapter (PWA 85640).
   (c) Secure Pusher/Puller to rear face of handling fixture with eight detail bolts.

(13) Heat arbor, by suitable means, to relieve tight fit of locating snap.

(14) Actuate pusher/puller to seat hub on arbor plate.

(15) Secure the LPT hub to arbor using the detail bolts and washers.

(16) Allow arbor to return to room temperature.

Arbor Installation Tools
Figure 1003
(Task 72−53−00−400−002)

(17) Remove Pusher/Puller from handling fixture.
  (a) Relieve hydraulic pressure and disconnect pump.
  (b) Remove eight bolts which secure pusher/puller and store in adjacent threaded holes.
  (c) Unthread cylinder from adapter.

(18) Remove Adapter (PWA 85640) from arbor.
  (a) Remove four bolts and store in adjacent threaded holes.

(19) Remove Rear Retainer (PWA 85331) from LPT.
  (a) Remove bolts securing retainer to rear flange of turbine case.
  (b) Loosen hand knobs clamping handling fixture.
  (c) Remove retainer from LPT using two .500-13 lift holes marked FOR LIFTING TOOL VERITICAL ONLY.

(20) Remove Handling Fixture (PWA 86026 or PWA 85332) from LPT.
  (a) Unclamp handling fixture by removing four bolts securing clamp ring.
  (b) Remove fixture using hoist and suitable tooling.

(21) Secure front balance fixture to turbine case with twenty-six detail bolts.

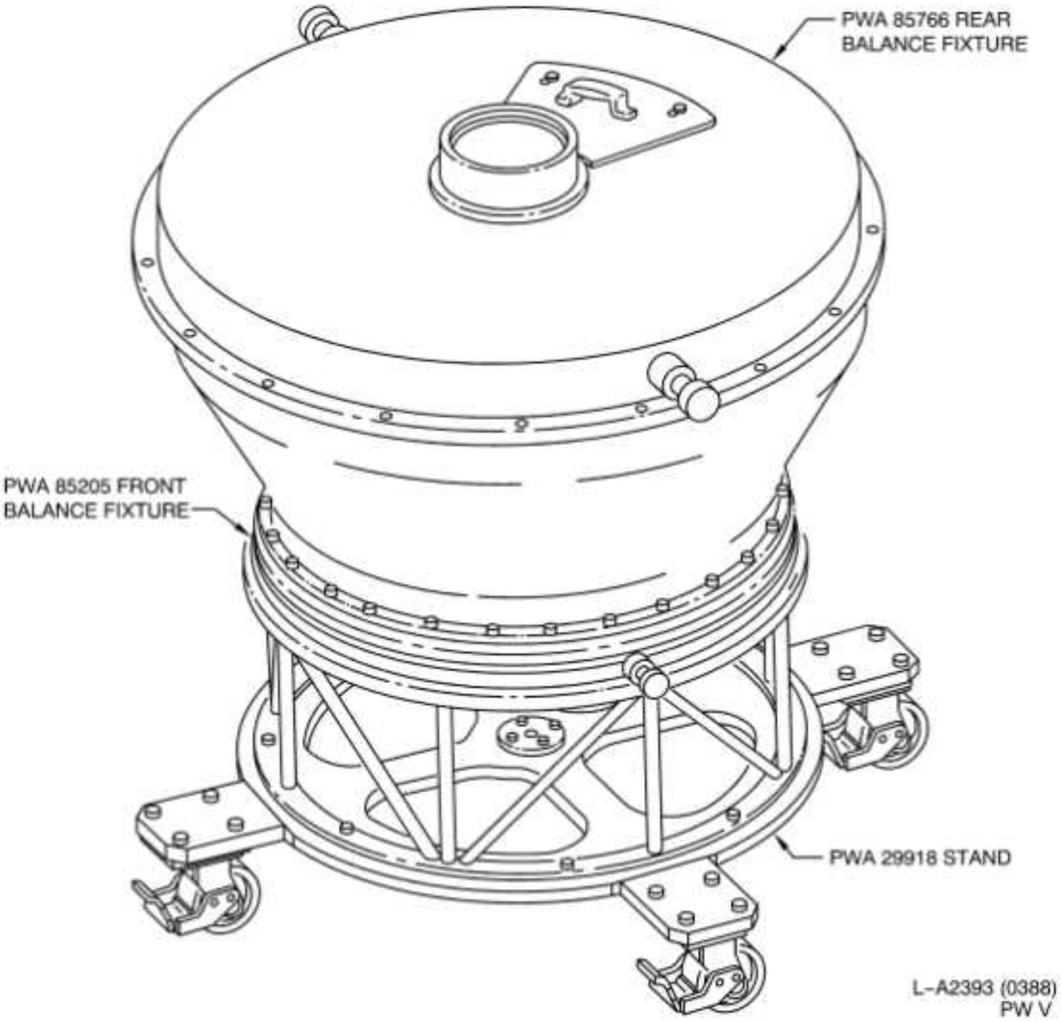
CAUTION: DO NOT CLAMP BALANCE BEARING WITH LOCK BOLTS. ERRONEOUS BALANCE INDICATION WILL RESULT FROM CLAMPING BEARING TO REAR BALANCE FIXTURE.

(22) Install PWA 85766 Rear Balance Fixture. See Figure 1004.
  (a) Position the four lock bolts so that the arbor bearing will not interfere. Secure bolts in this position with nuts.
  (b) Align dowel pin clearance hole and secure fixture to rear flange of turbine with detail bolts and washers.

NOTE: Do not secure bearing with lockbolts.

D. Postrequisites

(1) Balance low pressure turbine per Assembly-03 (Task 72-53-00-400-003).



PWA 85766 REAR BALANCE FIXTURE
PWA 85205 FRONT BALANCE FIXTURE

(Task 72-53-00-400-002)

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-03

Task 72-53-00-400-003:

1. Balance Low Pressure Turbine

NOTE: It is not necessary to do Assembly-03 Task 72-53-00-400-003 balance of the low pressure turbine if the balance procedure of Assembly-12 Task 72-53-00-400-012 is done with the low pressure turbine shaft and the Stage 3 low pressure turbine rotating air seal that has a balance counterweight flange. See Assembly-12 Task 72-53-00-400-012. If Assembly-12 Task 72-53-00-400-012 is not done, balance of the low pressure turbine must be done by Assembly-03 Task 72-53-00-400-003.

A. Prerequisites

(1) See Inspection/Check-04 Task 72-53-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Prepare low pressure turbine for balancing per Assembly-02 Task 72-53-00-400-002.

B. Equipment And Materials Necessary

Special Tools:

PWA 28657	Sling (2 Necessary)
PWA 76154	Adapter (4 Necessary)
PWA 85211	Weight, Balance
PWA 85234	Riveter
PWA 85686	Weight, Calibration (Front) (Check Weight)
PWA 85687	Weight, Calibration (Rear) (Check Weight)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	A/R	72-53-00/3/460

C. Procedure

Subtask 72-53-00-430-061:

(1) Using two PWA 28657 Slings, four PWA 76154 Adapters and hoists, lift low pressure turbine at trunnion spools and front and rear balance fixtures, and trunnion assembly to horizontal position. Remove arbor lift eyes.

(2) Place LPT assembly on pedestals of Gisholt balance machine or equivalent. Remove slings and hoists.

(3) Attach the direct drive to the forward end of the balance arbor.

(4) Operate the dynamic balance machine.

  (a) Find the dynamic unbalance of the low pressure turbine assembly while it turns at 900 rpm minimum.

  (b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(5) Prepare to rotate (turn) the balance arbor as follows:

  (a) Make a reference mark on the direct drive and the balance arbor with a Marker P05-045 to identify the original location.

(6) Remove the low pressure turbine assembly from the balance machine.

(7) Remove the balance arbor from the low pressure turbine assembly. See Assembly-04, Task 72-53-00-400-004.

(8) Turn the balance arbor 180 degrees from the original location and install the balance arbor to the low pressure turbine assembly. See Assembly-02, Task 72-53-00-400-002.

(9) Install the low pressure turbine assembly in the balance machine.

(10) Attach the direct drive to the forward end of the balance arbor.

(11) Dynamic balance the low pressure turbine assembly. See Figure 1001.

(a) Find the dynamic unbalance of the low pressure turbine assembly while the assembly turns at 900 rpm minimum.

(b) The initial unbalance must not be more than 25 oz−in. (18000.0 g.mm) for Plane W and 25 oz−in. (18000.0 g.mm) for Plane X. However, if the unbalance vectors are within 30 degrees, then the initial unbalance must not be more than 12.5 oz−in. (9000.0 g.mm) for Plane W and 12.5 oz−in. (9000.0 g.mm) for Plane X.

NOTE: If initial unbalance exceeds permissible amount, strip rotor and inspect for fits, burrs, runout and unbalance in individual components.

(c) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(d) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(12) Balance the assembly to get a remaining unbalance of 0.5 oz−in. (360.0 g.mm) maximum in the front, Plane W, plane.

(a) Residual unbalance must not be more than 0.5 oz−in. (360.0 g.mm) in the front plane (the tierod flange of the 3rd stage airseal).

1 Correct unbalance at front, Plane W, by adding any combination of counterweights PN 584943, PN 584944 or PN 534492, up to four maximum, within ± 20 degrees of unbalance vector.

2 It is permissible to fine trim front plane with up to two additional counterweights at any angular location.

3 Install rivets through counterweights and rivet holes in 3rd stage LPT airseal (1001/2). Secure rivets using PWA 85234 Riveter .

(13) Balance the assembly to get a remaining unbalance of 0.5 oz−in. (360.0 g.mm) maximum in the rear, Plane X, plane.

(a) Residual unbalance must not be more than 0.5 oz−in. (360.0 g.mm) in the rear plane (the 6th stage disk).

1 Correct the residual unbalance in the rear plane by adding any class of the PWA 85211 Balance Weight up to a maximum of four in ± 20 degrees of the unbalance vector.

2 Fine trim the rear plane by the replacement of any of the four PWA 85211 Balance Weight.

3 Install the balance weights to the tierods that attach the 6th stage disk.

NOTE: Do not remove the tierod nuts.

(14) Record the angle and the amount of assembly unbalance in the front and rear planes.

(15) Optional process based on the experience of the operator, do a check of the dynamic balance machine as follows:

(a) Install the front plane PWA 85686 Calibration Weight (Check Weight) to the rivet hole in the 3rd stage airseal flange as close as possible to the heavy angle.

NOTE: Do not install a check weight at a location where a counterweight is installed.

(b) Turn the dynamic balance machine at 900 rpm minimum. Check the machine, with the check weight installed in the front plane.

1 The check weight on the front plane pulls 4.04 oz−in. (2909.0 g.mm).

2 Read the angle and the amount of assembly unbalance in the front plane.

3 The amount of unbalance in the front plane should agree in ± 0.4 oz−in. (288.0 g.mm) or less with the amount recorded when the assembly was balanced.

4 Remove the check weight from the front plane.

(c) Install the rear plane PWA 85687 Calibration Weight (Check Weight) to a tierod, as close as possible to the heavy angle, that attaches the 6th stage disk. Do not remove the tierod nut.

(d) Turn the dynamic balance machine at 900 rpm minimum. Check the machine, with the check weight installed in the rear plane.

1 The check weight on the rear plane pulls 4.0 oz−in. (2880. g.mm).

2 Read the angle and the amount of assembly unbalance in the rear plane.

3 The amount of unbalance in the rear plane should agree in ± 0.4 oz−in. (288.0 g.mm) or less with the amount recorded when the assembly was balanced.

4 Remove the check weight from the rear plane.

(16) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the dynamic balance machine.

(17) Disconnect direct drive from forward end of balance arbor (or remove drive belt from forward end of arbor).

(18) After balancing, LPT assembly shall not be disassembled except with requirement for subsequent rebalance.

(19) Attach two PWA 28657 Slings and hoists to trunnion spools on front and rear balance fixtures. Lift assembly from balance machine, trunnion to vertical, (front end down) position and place into PWA 29918 Stand.

(20) Remove slings and hoists.

D. Postrequisites

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-03

(1) Final assemble low pressure turbine per Assembly-04 Task 72-53-00-400-004.

Low Pressure Turbine Balancing
Figure 1001
(Task 72-53-00-400-003)

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-04

Task 72-53-00-400-004:

1. Final Assemble Low Pressure Turbine

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-53-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Balance low pressure turbine per Assembly-03 (Task 72-53-00-400-003).

B. Equipment And Materials Necessary

Special Tools:

PWA 28657	Sling (2 Necessary)
PWA 29390	Hydraulic Pump
PWA 76154	Adapter (2 Necessary)
PWA 85232	Fixture
PWA 85331	Retainer, Rear
PWA 85332	Fixture, Handling (Optional To PWA 86026)
PWA 85333	Pusher/Puller
PWA 85576	Stand, Storage
PWA 85640	Adapter
PWA 86026	Fixture, Handling (Optional To PWA 85332)
PWA 86206	Adapter, Lift And Trunnion (2 Necessary)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

C. Procedure

Subtask 72-53-00-430-062:

(1) Remove PWA 85766Rear Balance Fixture.

(a) Using hoist, attach PWA 28657 Sling to trunnion spools on fixture with two PWA 76154 Adapters.

(b) Remove screws securing fixture to rear turbine case flange.

(c) Using hoist, remove fixture from case.

(2) Remove PWA 85211 Counterweights and install engine counterweights. See Figure 1001.

(a) Remove temporary counterweights from tierods. Remove tierod nut and spacer from temporary counterweight locations.

(b) Assemble same class engine counterweight to tierod at temporary counterweight locations.

(c) Treat threads of tierod and washer face of nut with, Engine Oil P03−001. Omit lubrication of disk. Install counterweights and nuts to secure counterweights.

(d) Install PWA 85232 Angle Of Turn Fixture onto 6th stage disk. Align bushings (1001/6) with tierod nuts (1001/11) and position plate (1001/4), stamped markings up, over disk.

(e) (Reference 1251, 1252, or 1253) Torque nuts at the counterweight locations with the use of a 0.500 inch square drive torque wrench installed in the socket over the dial indicator.

1 Apply initial torque of 140 − 160 lb−in. (15.818 − 18.078 N.m) to each nut.

CAUTION: THE FOLLOWING TORQUING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN MATING PARTS.

2 Loosen the nuts at the counterweight location.

3 Measure the torque necessary to turn the nut. If the measured torque is less than 50 lb−in. (5.469 N.m), then tighten to a torque of 45 lb−in. (5.084 N.m) plus or minus 5 lb−in. (0.565 N.m) and continue with the angle of turn.

4 If the measured torque is more than 50 lb−in. (5.649 N.m), find the torque necessary to turn the nut, add 15 lb−in. (1.695 N.m) plus or minus 5 lb−in. (0.565 N.m) to this torque. The total torque cannot be more than 100 lb−in. (11.298 N.m).

LOW PRESSURE TURBINE (LPT) − ASSEMBLY−04

5 Apply the final angle of turn:

a (Reference 1251) (Pre SB PW4ENG 72−256) For engines with the 5th stage turbine hub PN 50N405, set the indicator dial (1019/9) to zero with the index mark (1019/7) on the fixture plate. Tighten the thumbscrew (1019/5) to set the indicator dial. Apply a 62 − 66 degree angle of turn.

b (Reference 1252) (Post SB PW4ENG 72−256) For engines with 5th stage turbine hub PN 50N505, set the indicator dial (1019/9) to zero, with with the index mark (1019/7) on the fixture plate. Tighten the thumbscrew (1019/5) to set the indicator dial. Apply a 64 − 68 degree angle of turn.

c (Reference 1253) For engines with 5th stage turbine hub PN 51N305 and subsequent, set the indicator dial (1019/9) to zero, with the index mark (1019/7) on the fixture plate. Tighten the thumbscrew (1019/5) to set the indicator dial. Apply a 52 − 56 degree angle of turn.

NOTE: Use Reference 1253 for Phase−3 engines as built by P&W that have 5th stage turbine hub PN 51N305 and subsequent.

6 Do this torque procedure, steps 1 through 5, again as applicable on all tierod nuts. Use the torque sequence numbers stamped on the fixture.

(f) Remove the angle of turn fixture.

(3) Remove the bolts and washers securing turbine hub to arbor. Return these details to arbor after its removal.

(4) Install PWA 85640 Adapter to rear face of arbor with four detail bolts.

(5) Install handling fixture.

(a) Install PWA 85332 Handling Fixture (Optional to PWA 86026).

1 Position handling fixture using suitable lifting tool, while locator is installed in one tierod hole to align module with fixture.

2 Slide lockring rearward using two Handle T rods, to expand clamps. Secure lockring with four screws, so that clamps interface with turbine rear hub bore.

(b) Install PWA 86026 Handling Fixture (Optional to PWA 85332).

1 Install locator (detail−8) onto tierod where tierod nut has been removed.

2 Measure 5th stage hub flange with template (detail−18). If flange thickness is approximately 0.680 inch (17.272 mm), then install spacer (detail−17). If flange thickness is approximately 0.813 inch (20.650 mm), then spacer is not used.

3 Position handling fixture using PWA 85635 Lift Adapter, while locator is installed on one tierod. Locator aligns LPT with fixture.

4 Tighten four hex head bolts to engage supports and arms into 5th stage hub.

(6) Install PWA 85331 Rear Retainer.

(a) Lift retainer, using eyebolts installed in two 0.500−13 lift holes marked FOR LIFTING TOOL VERTICALLY ONLY.

(b) Position retainer over previously installed handling fixture and secure to case with 48 screws and washers.

(c) Lock axial position of LPT rotor by tightening eight hand knobs against handling fixture.

(7) Using hoist, attach PWA 28657 Sling and two PWA 86206 Lift And Trunnion Adapters to rear retainer at spools labeled LPT WITHOUT SHAFT. See Figure 1002.

(8) Remove twenty−six bolts securing front balance fixture to case.

(9) Install PWA 85333 Pusher/Puller.

- (a) Attach PWA 29390 Hydraulic Pump.
- (b) Actuate (to extend) cylinder and thread into PWA 85640 Adapter.
- (c) Secure Pusher/Puller to rear face of handling fixture with eight detail bolts.

(10) Actuate hydraulic pump to press LPT free of arbor, while maintaining tension on sling with hoist.

(11) Lift assembly from stand and trunnion to vertical, rear end down position. Remove hoist and lifting tools.

(12) Remove balance arbor from front balance fixture.

- (a) Attach detail lift eye.
- (b) Disengage six bearing clamps.
- (c) Using hoist return arbor to detail storage box.

(13) Remove front balance fixture from stand.

- (a) Using hoist, attach Sling (PWA 28657) to trunnion spools on fixture with two Adapters (PWA 76154).
- (b) Remove fixture.

(14) Return assembly to stand.

(15) Install classified pins (1003/5) into 3rd stage LPT sealing ring (1003/2) and 3rd stage sealing ring damper (1003/3). See Figure 1003.

- (a) Position damper onto sealing ring with three equally spaced (smaller) holes in each part aligned.
- (b) Determine hole size at each of three hole locations.
- (c) (Reference 1181) Select classified pin for each hole location to obtain fit of 0.000 inch (0.000 mm) loose to 0.002 inch (0.051 mm) tight.

(d) Install classified pins into sealing ring and damper.

(16) Install the sealing ring (1003/2), the damper (1003/3), and the classified pins (1003/5) (as an assembly) into the 3rd stage LPT duct (1003/4), by engaging three pinheads into three equally spaced (larger) holes in the duct. Secure with 39 bolts (1003/1), lubricated with Engine Oil P03−001.

NOTE: If workbolts are used, remove workbolts from duct assembly.

NOTE: If a 3rd stage LPT airseal (50N007) with four knife−edge seals is used then the longer 3rd stage LPT sealing ring (50N266) is necessary.

(17) Torque bolts (1003/1) to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(18) Lift assembly from stand and trunnion to vertical, front end down position.

(19) Return assembly to Stand (PWA 29918) or PWA 85576 Storage Stand .

(20) Position identification plate (1004/2) onto bracket on front (lower) flange of turbine rear case. Secure plate with two bolts (1004/1), with threads lubricated with Engine Oil P03−001, and nuts (1004/3). Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 1004.

Task 72-53-00-400-005:

1. Install Low Pressure Turbine External Parts

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, AS3214-02				

B. Procedure
See Figure 1001.

NOTE: All brackets to be installed are located on low pressure turbine case (1001/1) at approximately 3.4 inches (86.360 mm) from front flange of low turbine case.

(1) For cases with welded on bracket bosses (Pre SB PW4ENG 72-336), position bracket (1001/2) on boss on case at approximately 2:30 o'clock position (as viewed from front). Secure bracket using bolts (1001/3), lubricated with Engine Oil (P03-001). Torque bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Lockwire bolts.

NOTE: Cases that are (Post SB PW4ENG 72-336) incorporate brackets that are riveted to the case.

(2) Position bracket (1001/5) on boss on case at approximately 3:30 o'clock position (as viewed from front). Secure bracket using bolts (1001/4), lubricated with Engine Oil (P03-001). Torque bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Lockwire bolts.

(3) Position brackets (1001/6) and (1001/7), and locate as shown on boss on case at approximately 9:30 o'clock position (as viewed from front). Secure bracket using bolts (1001/4) lubricated with Engine Oil (P03-001). Torque bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Lockwire bolts.

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-06

Task 72-53-00-400-006:

1. Install Front Compressor Drive Turbine Shaft

NOTE: This procedure is not applicable if you balance the low pressure turbine module with the turbine shaft installed. See Assembly-07 Task 72-53-00-400-007 to install the turbine shaft prior to balancing the turbine module and shaft assembly.

A. Prerequisites

(1) See Inspection/Check-04 Task 72-53-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Balance low pressure turbine per Assembly-03 Task 72-53-00-400-003.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

NOTE: The flameless heat gun specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 25096	Stand, LPT Transportation And Storage (Optional To PWA 87330)
PWA 28657	Sling, Strongback
PWA 29390	Pump, Hydraulic
PWA 29754	Control, Heater
PWA 29956	Eye, Handling
PWA 76270	Stand (Optional To PWA 87330)
PWA 85221	Adapter, Lift And Trunnion
PWA 85233	Fixture, Angle-Of-Turn (Optional To PWA 88114)
PWA 85240	Bender, Manual
PWA 85319	Heater, Electrical
PWA 85333	Pusher/Puller, Hydraulic

Special Tools:

(CONTINUED)

PWA 85456	Retainer, Front (Optional To PWA 85996)
PWA 85558	Adapter, Hydraulic Cylinder
PWA 85562	Sleeve, Support (Used With PWA 25096 Or PWA 76270 Stand)
PWA 85996	Retainer, Front (Optional To PWA 85456)
PWA 86206	Adapter, Lift And Trunnion (2 Necessary)
PWA 88114	Fixture, Angle Of Turn
PWA 87330	Stand, Storage
PWA 87347	Sleeve, Support (Used With PWA 87330 Stand)

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock, Turbine	24	72−53−00/1/50

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless heat gun or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless heat gun, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

LOW PRESSURE TURBINE (LPT) − ASSEMBLY−06

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

LOW PRESSURE TURBINE (LPT) − ASSEMBLY−06

D. Procedure

CAUTION: IF A 3RD STAGE LPT AIRSEAL (50N007) WITH FOUR KNIFE−EDGE SEALS IS USED THEN THE LONGER 3RD STAGE LPT SEALING RING (50N266) IS NECESSARY.

(1) Install 3rd stage LPT airseal (1001/1) to turbine rear hub (1001/2). See Figure 1001.

CAUTION: TEMPERATURE OF AIRSEAL MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO PART MAY OCCUR.

(a) Heat airseal to obtain minimum temperature differance of 250°F (139°C) between mating parts.

(b) If required, install LPT shaft on PWA 25096 Stand, PWA 76270 Stand or PWA 87330 Stand. Install PWA 85562 Support Sleeve into the shaft support cradles of PWA 25096 Stand, PWA 76270 Stand or PWA 87347 Support Sleeve into the shaft support cradles of PWA 87330 Stand. Position details−1 and −2 forward and details−3 and −5 rearward with details−2 and −3 down. Tighten the set screws to attach the sleeve to the stand. Use PWA 29956 Handling Eye and PWA 85221 Adapter, to put the shaft in the stand. Secure shaft to stand.

(c) Find the position of the axial high point symbols (Letter H within circle), on front compressor drive turbine rear hub (1001/2) and the airseal (1001/1).

(d) If necessary, mark the residual (or high point symbol) unbalance on the turbine rear hub and the airseal as follows:

1 Use a shallow electrolytic etch mark. See 70−11 and SPOP 401 Task 70−11−00−280−006 Standard Practices Manual, PN 585005.

(e) Install the airseal to the turbine rear hub with the axial high point symbols (Letter H in a circle) 180 degrees apart. Align the bolt holes in the air seal with the bolt holes in the turbine rear hub and seat the airseal to the hub.

(2) Install turbine tierods (1002/2) onto front compressor drive turbine shaft.

(a) Install 24 tierods (1002/2) into shaft flange. Position tierod head so that lock slot faces inward.

(b) Install 24 tierod locks (1002/1), engaging slot in tierod and undercut on shaft OD, with prebent angle as shown in Figure 1002.

(c) Bend tierod locks to requirements of Figure 1002 using PWA 85240 Bender.

(3) Optional, install PWA 85319 Heater. See Figure 1003.

NOTE: You can use the optional flameless heat gun or flame torch as previously specified to heat the shaft flange.

(a) Position heater over LPT shaft against rear conical surfaces of shaft.

(b) Secure heater to shaft with three swivel head screw details of heater.

(4) Install low pressure turbine to turbine shaft. See Figure 1004.

(a) Using hoist install PWA 28657 Sling and two PWA 86206 Lift And Trunnion Adapters to rear retainer at spools labeled "LPT WITHOUT SHAFT".

(b) Lift assembly from stand, and trunnion to horizontal position.

(c) Position assembly to rear of shaft. Loosen clamps of stand and rotate shaft as required to put the axial high point symbol on the shaft 180 degrees from the axial high point symbol of the 3rd stage LPT air seal.

(d) Position PWA 85558 Adapter to rear face of shaft, and attach with eight screws.

(e) Install PWA 85333 Hydraulic Puller to PWA 85026 Handing Fixture or PWA 85332 Handing Fixture and PWA 85558 Adapter. Attach PWA 29390 Hydraulic Pump.

NOTE: If applicable, route heater cord through slot in pusher/puller plate.

(f) For heating the shaft with PWA 85319 Heater procede as follows:

  1 Connect PWA 29754 Heater Control to junction box of heater.

  2 Attach thermocouple connector to heater control.

  CAUTION: TEMPERATURE OF TURBINE SHAFT MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO PART MAY OCCUR.

(g) Use the PWA 85319 Heater, or the optional flameless heat gun or flame torch, to heat the shaft flange. Heat the flange to obtain a minimum temperature difference of 250° (138.8°) between mating parts.

(h) Actuate hydraulic pump to seat shaft.

(i) Disconnect heater, if applicable, and allow parts to return to room temperature.

(j) Align the center hole in PWA 85456 Front Retainer or PWA 85996 Front Retainer (1005/3) with the dowel pin hole in the turbine case. Attach the retainer to the front flange of the case at 6 and 12 o'clock locations with four bolts (1005/2) and nuts (1005/1). Attach the clamps of the retainer to the front compressor drive turbine shaft with two bolts (1005/4). See Figure 1005.

(k) Relieve hydraulic pressure, and remove puller from handling fixture.

(l) Remove PWA 85558 Adapter from rear face of turbine shaft.

(m) Lubricate the threads of six turbine shaft tierods with Engine Oil P03−001, equally spaced (60 degrees apart) to make three opposite pairs.

  CAUTION: OPTIONAL NUT PART NUMBERS ARE OF DIFFERENT WEIGHT GROUPS. USE 24 NUTS OF THE SAME PART NUMBER IF POSSIBLE. IF THIS IS NOT POSSIBLE, INSTALL NUTS OF

THE SAME PART NUMBER EQUALLY SPACED FROM EACH OTHER.

(n) Lubricate the washer face of six turbine tierod nuts with Engine Oil P03−001 and based upon the engine model and the applicable service bulletins, determine if washers are necessary for assembly under the tierod nuts. See Figure 1006. Lubricate all necessary washers with Engine Oil P03−001.

(o) Install six tierod nuts and washers, if necessary for the engine configuration as determined from Figure 1006, onto the equally spaced tierods. Use an opposite pattern sequence to torque the six tierod nuts to 1,000 lb−in. (112.985 N.m).

(p) Treat the threads of the remaining 18 turbine shaft tierods and the washer face of the tierod nuts with Engine Oil P03−001. Lubricate 18 turbine tierod washers, if necessary for the engine assembly configuration as determined from Figure 1006, with Engine Oil P03−001.

(q) Install the remaining 18 tierod washers, if necessary as determined from Figure 1006, and the tierod nuts onto the LPT shaft tierods. Apply an initial seating torque of 550 − 650 lb−in. (62.142 − 73.440 N.m). Use an opposite pattern sequence to complete the initial torque on all the tierods.

(r) Slide chocks at rear of PWA 25096 Stand inward to contact case OD. Adjust shaft position, as necessary, so that front face of Flange P rests against rear face of chock. Secure shaft with two detail clamps.

NOTE: Chocks are used as a safety device and do not support any part of the assembly.

(s) Loosen eight hand knobs of PWA 85331 Rear Retainer. Remove 48 screws securing retainer to rear flange of turbine case. Remove fixture, hoist and sling.

(t) Remove PWA 86026 Handling Fixture or PWA 85332 Handling Fixture.

(u) Remove heater which is clamped to turbine shaft.

(v) Position the PWA 85233 Angle−Of−Turn Fixture or PWA 88114 Angle−Of−Turn Fixture, to the rear face of the turbine shaft. Secure the fixture with four detail screws for PWA 85233 Fixture, or eight detail screws for PWA 88114 Fixture.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158 THE FOLLOWING TORQUEING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN THE NUTS AND THE TIERODS.

(w) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72−256 and with 5th stage hub PN 50N405 prior to letter change "N") (Reference 977) For engines without the revised LPT airfoils, the new 5th stage turbine hub, and the new 5th stage airseal). Apply final torque to 24 turbine shaft tierod nuts.

1 FOR THESE MODELS: 4152, 4156A, 4158
Loosen one pair of nuts (180 degrees apart), then retighten to seating torque of 80 − 90 lb−in. (9.039 − 10.169 N.m).

2 FOR THESE MODELS: 4152, 4156A, 4158
Set the indicator dial, on the fixture, to zero with the index mark on the fixture plate. Tighten the thumbscrew to set the indicator dial. Apply 60 − 64 degree angle of turn.

3 FOR THESE MODELS: 4152, 4156A, 4158
Apply steps 1 and 2 to all remaining pairs of nuts in the torque sequence indicated on the fixture.

4 FOR THESE MODELS: 4152, 4156A, 4158
As an option to improve LPT module and shaft balance characteristics, you can do the following: Loosen and reseat one pair of tierod nuts as indicated in step 1 above, then do steps 2 and 3 again to apply the final torque to all of the tierod nuts.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158 THE FOLLOWING TORQUEING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN THE NUTS AND THE TIERODS.

(x) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72−256 and Pre SB PW4ENG 72−256 with 5th stage hub PN 50N405 change Letter N or subsequent) (Reference 982) For engines with the revised LPT airfoils, the new 5th stage turbine hub, and the new 5th stage airseal. Apply final torque to 24 turbine shaft tierod nuts.

1 FOR THESE MODELS: 4152, 4156A, 4158
Loosen one pair of nuts (180 degrees apart).

2 FOR THESE MODELS: 4152, 4156A, 4158
Measure the torque necessary to turn the nut through the locking feature of the nut. Make sure the nut is not in contact with the disk face.

3 FOR THESE MODELS: 4152, 4156A, 4158
If the measured torque is less than 50 lb−in. (5.649 N.m), then tighten to a seating torque of 40 − 50 lb−in. (4.519 − 5.649 N.m) and continue with step 5.

4 FOR THESE MODELS: 4152, 4156A, 4158
If the measured torque is more than 50 lb−in. (5.649 N.m), find the torque necessary to turn the nut. Add 10 − 20 lb−in. (1.130 − 2.260 N.m) to this torque and tighten the nut using the total torque. The total torque must not be more than 200 lb−in. (22.597 N.m).

5 FOR THESE MODELS: 4152, 4156A, 4158
Set the indicator dial, on the fixture, to zero with the index mark on the fixture plate. Tighten the thumbscrew to set the indicator dial. Apply 59 − 63 degree angle of turn.

6 FOR THESE MODELS: 4152, 4156A, 4158
Do the torque procedure steps 1 through 5 again on all remaining pairs of nuts. Use the torque sequence numbers stamped on the fixture.

7 FOR THESE MODELS: 4152, 4156A, 4158
As an option to improve LPT module and shaft balance characteristics, you can do the following: Loosen one pair of tierod nuts as indicated in step 1 above, then do steps 2 through 6 to complete the seating and reapplication of the final torque on all of the tierod nuts.

CAUTION: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 THE FOLLOWING TORQUEING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN THE NUTS AND THE TIERODS.

(y) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 (Post SB PW4ENG 72−505) (Reference 983) Apply the final torque to the 24 turbine shaft tierod nuts.

1 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Loosen one pair of nuts (180 degrees apart).

2 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Measure the torque necessary to turn the nut through the locking feature of the nut. Make sure the nut is not in contact with the disk face. Add 10 − 20 lb−in. (1.130 − 2.260 N.m) to this torque and use the total torque to seat the nut. The total torque must not be more than 200 lb−in. (22.597 N.m).

3 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Set the indicator dial, on the fixture, to zero with the index mark on the fixture plate. Tighten the thumbscrew to set the indicator dial. Apply 58 − 62 degree angle of turn.

4 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Do torque procedure steps 1 through 3 again on all remaining pairs of nuts. Use the torque sequence numbers stamped on the fixture.

5 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
As an option to improve LPT module and shaft balance characteristics, you can do the following: Loosen one pair of tierod nuts as indicated in step 1 above, then do steps 2, 3 and 4 to complete the seating and reapplication of the final torque on all of the tierod nuts.

(z) Remove the angle of turn fixture and anti−torque adapter, if applicable.

E. Postrequisites

(1) Optional, dynamic balance the low pressure turbine with shaft assembly by Assemlby−07 Task 72−53−00−400−007, or semi−dynamically balance the low pressure turbine with shaft assembly to Assembly−11 Task 72−53−00−400−011.

NOTE: Dynamic and semi−dynamic balance procedures are optional balance procedures that are provided for use based on the operators experience to obtain an optimized low pressure turbine balance.

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-07

Task 72-53-00-400-007:

1. Balance The Low Pressure Turbine With The Turbine Shaft Installed (Prepare The Turbine And Shaft Assembly For Balance)

NOTE: This is an optional balance procedure that can be used, based on the operators experience, to obtain an optimized low pressure turbine balance.

A. Prerequisites

(1) Balance the low pressure turbine module. Refer to Assembly-03 Task 72-53-00-400-003. The residual unbalance must not exceed 0.5 oz-in. (360 g.mm) total.

(2) Locate the turbine shaft front plane residual unbalance amount and location. These are marked on the front OD of the shaft. The location is indicated by a symbol (the Letter L within a circle). If the symbol is not present, balance the shaft again. Refer to 72-53-80, Repair-16 Task 72-53-80-300-016.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun, Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

NOTE: The flameless heat gun specified above is optional to the heaters specified in the Special Tools list, and the optional flame torch.

Special Tools:

PWA 21350-58	Bearing, Rear
PWA 21350-35	Bearing, Balance
PWA 21350-59	Bearing, Balance (Optional To PWA 21350-35)
PWA 28657	Sling
PWA 29754	Control, Heater
PWA 29952	Retainer, Bearing
PWA 29956	Eye, Handling
PWA 76154	Adapter (2 Necessary)
PWA 85221	Adapter, Lift And Trunnion
PWA 85233	Fixture, Angle Of Turn (Optional To PWA

Special Tools:

(CONTINUED)

	88114)
PWA 85319	Heater, Electrical
PWA 85766	Fixture, Rear Balance
PWA 85879	Positioner, Bearing (Optional to PWA 87245)
PWA 86206	Adapter (2 Necessary)
PWA 86416	Fixture, Balance (Optional To PWA 87355)
PWA 87245	Adapter (Used With PWA PWA 88118)
PWA 87258	Stand, Build
PWA 87262	Sleeve, Guide (Used With PWA 87258 Stand)
PWA 87355	Fixture, Balance
PWA 87752	Stand, Build (Optional To PWA 87258)
PWA 87819	Spacer, Shaft
PWA 88114	Fixture, Angle Of Turn
PWA 88118	Sleeve, Bearing (Used With PWA 21350−35 Bearing)
PWA 88120	Adapter, Anti−Torque
PWA 88133	Adapter, Balance

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−045	Marker, Pen (PMC 4092)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	A/R	72−53−00/3/460

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Electric Flameless Heat Gun, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

NOTE: After you balance the LPT and shaft assembly, you can not disassemble it unless you balance it again.

Subtask 72−53−00−430−063:

(1) Put the PWA 87819 Spacer on the center pedestal (shaft holder) of the PWA 87752 Build Stand. See Figure 1001.

(2) If it is not there, install PWA 86416 Front Balance Fixture or PWA 87355 Front Balance Fixture in the build stand. See Figure 1001.

  (a) Lock the wheels of the build stand.

  (b) Open the hydraulic valve to lower the shaft holder.

  (c) Lock the shaft guide in the outboard position with the ball lock pins.

  (d) Attach hoists to the lifting eyes at the front and rear of the fixture. Use the hoists to trunnion the fixture to the front (tube end) down position. Remove the lower hoist and lifting eye. Lower the fixture into the build stand.

(3) Install PWA 21350−35 Balance Bearing (Front) and PWA 88118 Bearing Sleeve.

  NOTE: See the following step to install the optional PWA 21350−59 Bearing.

  (a) If necessary, use PWA 88133 Balance Adapter to balance the PWA 88118 Balance Bearing Sleeve before it is used initially; or for subsequent recheck balance of the sleeve.

(b) If necessary, assemble the PWA 21350−35 Bearing on the PWA 88118 Sleeve. Put the sleeve, flanged end down, on a bench. Heat the bearing and install it onto the sleeve until it touches the sleeve shoulder. Install the retaining ring detail into the groove on the sleeve.

(c) Put the bearing and sleeve assembly in hot Engine Oil P03−001 to increase its temperature.

(d) Assemble the bearing and sleeve assembly on the front end of the turbine shaft. Install PWA 87245 Adapter onto the turbine shaft and push the balance sleeve until it touches the step of the shaft.

(4) Optional, install PWA 21350−59 Balance Bearing on the turbine shaft.

(a) Put the PWA 21350−59 Balance Bearing (Front) in hot Engine Oil P03−001 to increase its temperature.

(b) Install the balance bearing on the front of the turbine shaft. Put a PWA 85879 Positioner over the turbine shaft and the balance bearing and push the positioner until it touches the end of the turbine shaft, then remove the positioner. See Figure 1002.

(5) Install a PWA 85221 Adapter on the front end of the turbine shaft. Connect a hoist to the adapter.

(6) Install a PWA 29956 Eye to the rear face of the turbine shaft. Connect a hoist to the eye.

(7) Open the two clamps of the stand. Use the two hoists to to lift and trunnion the shaft to the front end down position. Remove the lower hoist and adapter. Lower the shaft into the build stand and the front balance fixture. Remove the hoist and eye. See Figure 1003.

(a) Use a non−etching Marker P05−045 to mark the location of the runout (high point) on the rear OD of the turbine shaft.

Subtask 72−53−00−430−064:

(8) Actuate the hydraulic cylinder to adjust the height of the turbine shaft as required. The rear face of the turbine shaft tierod flange must be 12 inch (304.800 mm) above the balance fixture surface.

CAUTION: IF A 3RD STAGE LPT AIRSEAL (PN 50N007) WITH FOUR KNIFE−EDGE SEALS IS USED, THEN THE LONGER 3RD STAGE LPT SEALING RING (PN 50N266) IS NECESSARY.

(9) Install the 3rd stage LPT airseal to the turbine rear hub.

(a) Determine the position of the axial high point runout symbols (Letter H within a circle) on the turbine shaft and the 3rd stage LPT (rotating) airseal.

(b) Use a non−etching Marker P05−045 to mark the location of the axial high point runout on the rear OD of the airseal.

(c) Use a non−etching Marker P05−045 to mark the location of the axial high point runout on the rear OD of the turbine shaft.

NOTE: The turbine shaft and the airseal will be assembled with the the axial high point runout symbols approximately 180 degrees apart.

CAUTION: THE TEMPERATURE OF THE AIRSEAL MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO THE PART CAN OCCUR.

(d) Heat the airseal in an oven to obtain a minimum temperature differance of 250°F (139°C) between mating parts.

(10) Put the PWA 85319 Heater on the rear conical surface of the turbine shaft.

(a) Connect PWA 29754 Heater Control to the junction box of the heater.

(b) Attach the thermocouple connector to the heater control.

CAUTION: TEMPERATURE OF THE TURBINE SHAFT MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO THE PART CAN OCCUR.

(c) Heat the shaft to obtain a minimum temperature differance of 250°F (139°C) between the mating parts.

(11) Install the low pressure turbine to the turbine shaft. See Figure 1004.

(a) Use a hoist to install a PWA 28657 Sling and two PWA 86206 Adapters to the rear retainer at the trunnion spools labeled "LPT WITHOUT SHAFT".

(b) Lift the assembly from the stand, and trunnion to vertical, front end down, position. Position the assembly over the turbine shaft.

CAUTION: THIS IS A RAPID ASSEMBLY PROCEDURE. THE TIEROD NUTS MUST BE TIGHTENED QUICKLY OR THE TURBINE SHAFT WILL NOT FULLY SEAT ON THE TURBINE HUB.

(c) Disconnect and remove the heater from the turbine shaft.

(d) Determine the position of the axial high point symbols (Letter H within a circle) on the turbine shaft and 3rd stage (rotating) airseal. Align the tierods with the nearest tierod holes in the airseal, and assemble the heated airseal on the turbine shaft with the axial high point symbol of the airseal approximately 180 degrees from the axial high point symbol on the turbine shaft.

NOTE: If they are there, you can use the alignment marks on the airseal and shaft that were made during the disassembly of the the LPT module from the turbine shaft.

CAUTION: ASSURE THAT THE AIRSEAL CLEARS THE HONEYCOMB RING ASSEMBLY OR DAMAGE TO THE KNIFE−EDGES CAN OCCUR.

(e) Align the tierods in the turbine shaft with the tierod holes in the turbine hub and carefully lower the turbine module about halfway onto the tierods.

NOTE: You can install the turbine shaft at any location with respect to the low pressure module and 3rd stage airseal.

(f) Align the dowel pin in the front flange of the turbine case with the dowel pin hole in the front balance fixture. Lower the turbine module onto the turbine shaft and balance fixture. Remove the hoist, sling, and adapters.

(g) Lubricate the threads of six turbine shaft tierods with Engine Oil P03−001, equally spaced (60 degrees apart) to make three opposite pairs.

CAUTION: OPTIONAL NUT PART NUMBERS ARE OF DIFFERENT WEIGHT GROUPS. USE 24 NUTS OF THE SAME PART NUMBER IF POSSIBLE. IF THIS IS NOT POSSIBLE, INSTALL NUTS OF THE SAME PART NUMBER EQUALLY SPACED FROM EACH OTHER.

(h) Lubricate the washer face of six turbine tierod nuts with Engine Oil P03−001 and based upon the engine model and the applicable service bulletins, determine if washers are necessary for assembly under the tierod nuts. See Figure 1005. Lubricate all necessary washers with Engine Oil P03−001.

(i) Install six tierod nuts and washers, if necessary for the engine configuration as determined from Figure 1005, onto the equally spaced tierods. Use an opposite pattern sequence to torque the six tierod nuts to 1,000 lb−in. (112.985 N.m).

(j) Install 28 screws, with washers, through the front outer diameter flange of the turbine case into the front balance fixture.

(k) Treat the threads of the remaining 18 turbine shaft tierods and the washer face of the tierod nuts with Engine Oil P03−001. Lubricate 18 turbine tierod washers, if necessary for the engine assembly configuration as deteremined from the Figure 1005, with Engine Oil P03−001.

(l) Install the remaining 18 tierod washers, if necessary as determined from Figure 1005, and the tierod nuts onto the LPT shaft tierods. Apply an initial seating torque of 550 − 650 lb−in. (62.142 − 73.440 N.m). Use an opposite pattern sequence to complete the initial torque on all the tierods.

(m) Remove the PWA 85331 Retainer.

1 Loosen eight hand knobs of the retainer.

2 Remove 48 screws that hold the retainer to the rear flange of the turbine case.

3 Install two eyebolts into the two 0.500−13 tapped holes on rear side of retainer labeled "FOR LIFTING TOOL VERTICAL ONLY".

4 Use a hoist to connect a suitable sling to the eyebolts.

5 Use the hoist to remove the retainer. Remove the hoist, sling, and eyebolts.

(n) Remove the PWA 86026 Handling Fixture or PWA 85332 Handling Fixture. See Figure 1006.

1 Remove the four bolts that attach the clamp ring.

2 Use a hoist and suitable sling to remove the fixture.

(o) Position the PWA 85233 Angle−Of−Turn Fixture or PWA 88114 Angle−Of−Turn Fixture, to the rear face of the turbine shaft. For PWA 85233 Fixture, attach the fixture with four detail screws (1007/3). See Figure 1007. For PWA 88114 Fixture, attach the fixture with eight detail screws.

(p) For PWA 88114 Angle−Of−Turn Fixture, install PWA 88120 Anti−Torque Adapter as follows:

1 Put the flange of the adapter on the LPT case and the adapter arm between the antirotation lug of the angle−of turn fixture.

2 Attach the adapter to the LPT case with eight detail screws and nut assemblies.

(q) Depending upon the engine configuration and the applicable service bulletins, apply the final torque on all 24 tierod nuts using the applicable procedure (Reference 977, Reference 982 or Reference 983) as determined from Figure 1005 as specified as follows:

CAUTION: THE FOLLOWING TORQUEING PROCEDURE MUST BE ACCOMPLISHED WITH A MAXIMUM TEMPERATURE DIFFERENTIAL OF 40 DEGREES F (22.2 DEGREES C) BETWEEN THE NUTS AND THE TIERODS.

1 (Reference 977) Apply the final torque to 24 turbine shaft tierod nuts as follows:

a Loosen one pair of nuts (180 degrees apart). Torque to a seating torque of 80 − 90 lb−in. (9.039 − 10.169 N.m).

b Set the indicator dial (1007/8) to zero, with index mark (1007/6) on fixture plate. Tighten the thumbscrew (1007/4) to set the indicator dial. Apply 60 − 64 degrees angle of turn.

c Repeat steps a and b on all remaining pairs of nuts in the torque sequence stamped on the fixture.

d As an option to improve the LPT module and shaft balance characteristics, do the following: Loosen and reseat one pair of tierod nuts as indicated in step a above. Then repeat steps b and c above to reapply the final torque to all the tierod nuts.

CAUTION: THE FOLLOWING TORQUEING PROCEDURE MUST BE ACCOMPLISHED WITH A MAXIMUM TEMPERATURE DIFFERENTIAL OF 40 DEGREES F (22.2 DEGREES C) BETWEEN THE NUTS AND THE TIERODS.

2 (Reference 982) Apply the final torque to 24 turbine shaft tierod nuts as follows:

a Loosen one pair of nuts (180 degrees apart).

b Measure the torque necessary to overcome the locking feature of the nut. Make sure the nut is not in contact with the disk face.

c If the measured torque is less than 50 lb−in. (5.649 N.m), then tighten to a seating torque of 40 − 50 lb−in. (4.519 − 5.649 N.m) and continue to step e.

d If the measured torque is more than 50 lb−in. (5.649 N.m), find the torque necessary to turn the nut. Add 10 − 20 lb−in. (1.130 − 2.260 N.m) to this torque and tighten the nut using the total torque. The total torque must not be more than 200 lb−in. (22.60 N.m).

e Set the indicator dial (1007/8) to zero, with the index mark (1007/6) on the fixture plate. Tighten the thumbscrew (1007/4) to set the indicator dial. Apply 59 − 63 degrees angle of turn.

f Repeat steps a through e on all remaining pairs of nuts in the torque sequence stamped on the fixture.

g As an option to improve the LPT module and shaft balance characteristics, do the following:: Loosen and reseat one pair of tierod nuts, 180 degrees apart, as indicated in step a above. Then repeat steps b through f above to complete the seating and reapply the final torque to all the tierod nuts.

CAUTION: THE FOLLOWING TORQUEING PROCEDURE MUST BE ACCOMPLISHED WITH A MAXIMUM TEMPERATURE DIFFERENTIAL OF 40 DEGREES F (22.2 DEGREES C) BETWEEN THE NUTS AND THE TIERODS.

3 (Reference 983) Apply the final torque to 24 turbine shaft tierod nuts as follows:

a Loosen one pair of nuts (180 degrees apart).

b Measure the torque necessary to overcome the locking feature of the nut. Make sure the nut is not in contact with the disk face. Add 10 − 20 lb−in. (1.130 − 2.260 N.m) to this torque and tighten the nut with the total torque. The total torque must not be more than 200 lb−in. (22.60 N.m).

c Set the indicator dial (1007/8) to zero, with the index mnark (1007/6) on the fixture plate. Tighten the thumbscrew (1007/4) to set the indicator dial. Apply 58 − 62 degrees angle of turn.

d Repeat steps a through c on all remaining pairs of nuts in the sequence stamped on the fixture.

e As an option to improve the LPT module and shaft balance characteristics, do the following: Loosen one pair of tierod nuts, 180 degrees apart, as indicated in step a above. Then repeat steps b through d above to complete the seating and reapply the final torque to all the tierod nuts.

(r) Remove the angle of turn fixture and the antitorque adapter, if applicable.

(12) Install the 6th stage LPT airseal onto the rear of the turbine shaft. See Figure 1008.

(13) Put the PWA 85881 Spacer on the rear of the LPT shaft.

(14) Install the PWA 21350−58 Rear Balance Bearing on the rear of the turbine shaft.

(15) Put PWA 29952 Retaining Plate on the rear of the LPT and secure with four detail bolts.

CAUTION: MAKE SURE THAT THE REAR BALANCE BEARING TEMPERATURE IS COOLED TO WITHIN 10°F (5.5°C) OF THE AMBIENT TEMPERATURE BEFORE YOU INSTALL THE REAR BALANCE FIXTURE OR DAMAGE TO THE TOOLS CAN OCCUR.

(16) Put PWA 85766 Rear Balance Fixture on the rear of the LPT as follows: See Figure 1009.

(a) Loosen the four detail lock bolts.

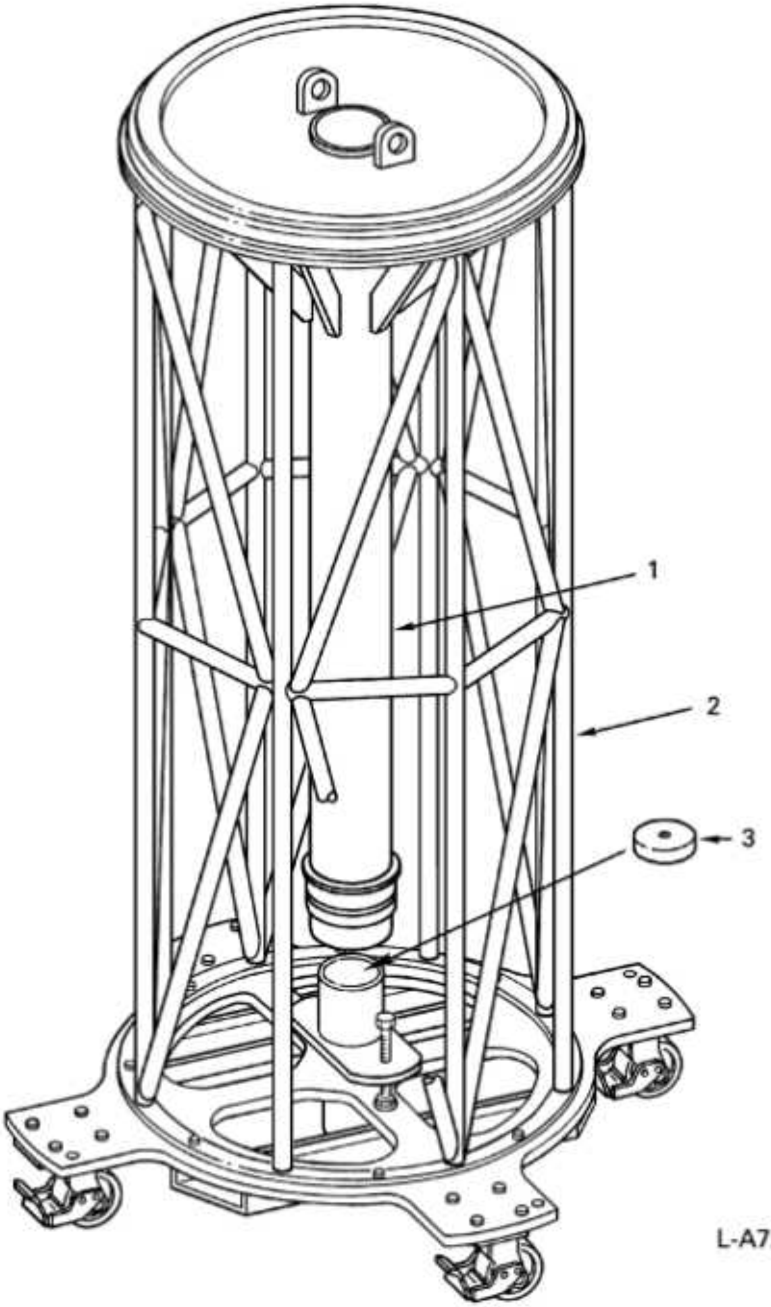
(b) Use a hoist to connect a PWA 28657 Sling , with two PWA 76154 Adapters, to the trunnion spools of the rear balance fixture. Use the hoist to position the fixture over the turbine assembly.

(c) Align the locating pin in the rear flange of the turbine case with the mating hole in the balance fixture. Lower the fixture onto the turbine case. Remove the hoist, sling and adapters. Secure the rear flange of the case with 22 detail cap screws and washers.

(d) Secure the four detail lock bolts.

E. Postrequisites

(1) Balance the low pressure turbine with shaft assembly. Refer to Assembly−12 Task 72−53−00−400−012.



L-A7287 (0393)

1. PWA 86416 Or PWA 87355 Front Balance Fixture

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-08

Task 72-53-00-400-008:

1. Balance Low Pressure Turbine With Shaft (Balance Procedure)

This Procedure Has Been Deleted

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-09

Task 72-53-00-400-009:

1. Balance The Low Pressure Turbine With The Turbine Shaft Installed (Remove The Turbine From The Turbine Shaft And/Or Install Counterweights On The Front Plane)

NOTE: This procedure is required if you must remove the turbine module to install counterweights to the front plane, or if you must reposition the turbine shaft relative to the 5th stage hub.

A. Prerequisites

(1) Balance the low pressure turbine with the turbine shaft installed. Refer to Assembly-12 (Task 72-53-00-400-012).

B. Equipment And Materials Required

Special Tools:
PWA 26147 Adapter (2 Required, Optional to PWA 85608)
PWA 28657 Sling
PWA 29390 Pump, Hydraulic
PWA 29952 Retainer, Bearing
PWA 85234 Riveter
PWA 85258 Puller, Jackscrew
PWA 85331 Retainer, Rear
PWA 85332 Fixture, Handling (Optional To PWA 86026)
PWA 85333 Pusher/Puller, Hydraulic
PWA 85558 Adapter, Hydraulic Cylinder
PWA 86026 Fixture, Handling (Optional To PWA 85332)
PWA 86206 Adapters (2 Required)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-045	Marker, Pen (PMC 4092)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Rivet	A/R	72-53-00	3	460

C. Procedure

NOTE: After you balance the LPT and shaft assembly, you can not disassemble it unless you balance it again.

Subtask 72−53−00−430−073:

(1) Loosen all of the LPT shaft tierod nuts, then remove any one nut.

(2) Install PWA 85332 (Optional to PWA 86026) Handling Fixture.

NOTE: See the following step for installation of PWA 86026 Fixture.

(a) Install the locator, Detail−11 onto the tierod where the tierod nut has been removed.

(b) Use a hoist and suitable sling to install the handling fixture.

NOTE: The locator aligns the LPT with the fixture.

(c) Slide the lockring rearward with the two T−handle rod details to expand the clamps. Secure the lockring with four screws, so that the clamps interface with the turbine rear hub bore.

(d) Remove the hoist and sling.

(3) Install PWA 86026 Handling Fixture (Optional to PWA 85332). See Figure 1001.

(a) Remove any one tierod nut and install the locator (1001/4) on the tierod (1001/5).

(b) Measure the 5th stage hub flange with the template, detail−18. If the flange thickness is approximately 0.680 inch (17.272 mm), then install the spacer, detail−17. If the flange thickness is approximately 0.813 inch (20.650 mm), the spacer is not used.

(c) Use a hoist and suitable sling to install the handling fixture.

NOTE: The locator aligns the LPT with the fixture.

(d) Move the fixture forward until it touches the rear face of the 5th stage hub.

(e) Use a steel rod in the two 0.625 inch (15.875 mm) diameter through holes of the fixture body to align the slots with the tierods in the 5th stage hub. Tighten the four screws (1001/3), one at a time, until the four supports (1001/2) are correctly engaged at the 5th stage hub bore. Ensure that the detail arms (1001/1) are engaged in the step provided in the fixture body.

(f) Remove the lift adapter.

(4) Install PWA 85331 Rear Retainer. See Figure 1002.

(a) Install two eyebolts into the two 0.500−13 tapped holes on rear side of retainer labeled "FOR LIFTING TOOL VERTICAL ONLY". Use a hoist to connect a suitable sling to the eyebolts.

(b) Put the retainer over the handling fixture and install it to the case with 48 screws (1002/1) and washers (1002/2).

(c) Remove the hoist, sling, and eyebolts.

(d) Lock the axial position of the LPT rotor by tightening the eight hand knobs (1002/3) against the handling fixture.

(5) Use a hoist to attach a PWA 28657 Sling and two PWA 86206 Adapters to the retainer at the spools labeled "LPT WITHOUT SHAFT".

(6) Remove the remaining 23 nuts that hold the shaft to the hub. Remove the locator detail from the tierod.

(7) Put the PWA 85558 Adapter to the rear face of the shaft and attach it with eight screws. See Figure 1003.

(8) Install PWA 85333 Hydraulic Pusher to PWA 85331 Retainer and PWA 85558 Adapter. Attach PWA 29390 Hydraulic Pump to the pusher.

(9) Remove the bolts that hold the turbine case front flange to the front balance fixture.

(10) Actuate the hydraulic pump to remove the turbine assembly from the turbine shaft.

Front Compressor Drive Turbine Shaft Removal
Figure 1003
(Task 72-53-00-400-009)

(11) Remove the hydraulic pump and pusher from the retainer. Remove the PWA 85558 Adapter from the rear end of the turbine Shaft.

(12) Use the hoist to put the turbine assembly on two suitable stands. Leave the hoist connected to the rear fixture. See Figure 1003.

Subtask 72−53−00−430−074:

(13) Remove the 3rd stage LPT airseal (1004/4) with a PWA 85258 Jackscrew Puller. See Figure 1004.

(a) Remove the two ball lock pins (1004/8), loosen the four screws (1004/9) and retract the puller plates (1004/7). Rotate locking lugs (1004/1) to face inward.

(b) Insert the puller into the airseal. Adjust the screws (1004/5) as required to seat the ring on the ID flange of the turbine rear hub. Rotate the locking lugs to position the lug under the rear face of the hub flange.

(c) Extend the puller plates (1004/7) outward to position the radius of the puller plates against the mating radius in the ID of the airseal. Reinstall the two ball lock pins (1004/8). Tighten four screws (1004/6) to secure the puller plates.

CAUTION: TIGHTEN THE SCREWS IN SMALL INCREMENTS IN A PATTERN SEQUENCE TO PREVENT DAMAGE TO THE NYLON PAD DETAILS OF THE SCREWS. IF THE SCREWS GO THROUGH THE DETAIL PADS, THEY WILL DAMAGE THE AIRSEAL.

(d) Tighten the screws (1004/5) in small increments in a pattern sequence to remove the airseal from the hub.

(e) Loosen the knurled nuts (1004/2) and rotate the locking lugs (1004/1) to face inward. Remove the ball lock pins, loosen screws (1004/9), and retract the puller plates. Remove the puller from the airseal.

(f) Remove the airseal from the turbine rear hub and place it in suitable protective container.

Third Stage LPT Airseal Removal
Figure 1004
(Task 72−53−00−400−009)

(14) Remove 39 bolts that secure the Stage 3 (inner) sealing ring and damper assembly. See Figure 1005.

Subtask 72−53−00−430−075:

CAUTION: DO NOT REMOVE THE PREVIOUSLY INSTALLED NON−COLORED COUNTERWEIGHTS.

(15) Install colored (painted) counterweights as required to the 3rd stage airseal.

(a) Align the wax that was added to the airseal (behind the airseal) with a corresponding location on the airseal scalloped flange. Mark the location with a Pen (P05−045). Remove the beeswax from the airseal.

(b) Weigh the beeswax to determine the correct counterweight part number.

(c) Determine the weight of the counterweight as follows:

1 Multiply the weight of the wax by 0.40. The result is the total adjusted weight (plus the rivet if required) to be added to the scalloped flange of the 3rd stage airseal.

2 See Table 1001 to select the counterweight part number. Use the closest adjusted weight to obtain the counterweight part number.

Counterweight Selection
Table 1001

(d) Install the applicable counterweight with rivets (heads rearward) to the correct rivet hole in the scalloped flange of the 3rd stage airseal. Use a PWA 85234 Riveter to flare the counterweight rivets to 0.125 inch (3.175 mm) minimum.

(16) Install the Stage 3 (inner) sealing ring assembly.

(a) Align the three larger holes in the ring with the mating pins and install the ring in the sealing ring damper. Secure with bolts lubricated with Engine Oil (P05-001).

(b) Tighten the bolts on each side of one of the three pins, then, loosen the bolts approximately 1/4 turn Repeat at the other two pin locations.

NOTE: Loosening the bolts at the pin locations will allow the ring assembly to seat at the other pin locations.

(c) Torque all of the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(17) Reinstall the LPT module onto the turbine shaft. Refer to Subtask 72-53-00-430-064 in Assembly-07 (Task 72-53-00-400-007).

(18) Balance the low pressure turbine and shaft assembly again and correct the unbalance as necessary until the assembly is within the unbalance limits. Refer to Subtask 72-53-00-430-065 in Assembly-12 (Task 72-53-00-400-012).

LOW PRESSURE TURBINE (LPT) - ASSEMBLY-10

Task 72-53-00-400-010:

1. Balance Low Pressure Turbine Assembly Balance Arbor (PWA 85457)
   A. Prerequisites
      (1) See Inspection/Check-01 (Task 72-09-51-200-004) for balance arbor bearing inspection.
   B. Equipment And Materials Required

      Special Tools:
      PWA 8170-31 Housing
      PWA 21350-35 Bearing, Balance (Two Required)
      PWA 85457 Arbor, Balance
      PWA 85604 Drift, Seating
      PWA 85605 Drift, Seating
      PWA 85620 Pedestal, Support
      PWA 85625 Puller, Jackscrew

   C. Procedure
      See Figure 1001.

      NOTE: This procedure will result in a balance arbor that has been balanced to correct for its own unbalance.

      New balance arbor should be balanced prior to use.

      Balance arbor should be rebalanced after 20 units (or less, as experience indicates) to ensure correct balancing of subsequent turbine assemblies.

   Subtask 72-53-00-910-001:
      (1) Install PWA 21350-35 Balance Bearings onto PWA 85457 Balance Arbor.
         (a) With arbor positioned on PWA 85620 Stand, place two balance bearings (detail-17) into hot oil tank at 250°F (121°C) for 20 minutes.
         (b) Remove bearing from hot oil tank and using PWA 85604 Drift and mallet, seat front bearing on arbor. Drift to remain in position until temperature has normalized. Secure bearing.
         (c) Remove bearing from hot oil tank and using PWA 85605 Drift and mallet, seat rear bearing on arbor. Drift to remain in position until temperature has normalized. Secure bearing.
      (2) Install PWA 8170-31 Housing to balance machine and secure with plate and cap screws, at both cradles.
      (3) Install balance arbor (PWA 85457) with bearings onto adapters previously installed. Install end drive.
      (4) Dynamically balance arbor as follows:

7. 4.56 Inch (115.824 mm) Diameter Reference
8. 4.75 Inch (120.650 mm) Diameter Reference
9. Threaded Set Screw Holes For Adding Or Removing Weight For Balancing Arbor (Rear Plane)
10. Rear Balance Bearing
11. Rear Bearing Retainer

Key To Figure 1001

(a) Calibrate balance arbor at 900 rpm to 0.040 oz−in. (29 g.mm) by adding or removing set screws as required at front and rear locations of arbor.

NOTE: Set screws must not protrude above arbor surface.

(5) Remove balance arbor from balancing machine.
(6) Using PWA 85625 Puller, remove front balance bearing from arbor, if necessary.
(7) Using PWA 85625 Puller, remove rear balance bearing from arbor, if necessary.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-53-00-400-011:

1. Semi-Dynamic Balance Low Pressure Turbine With Shaft (Balance Procedure)

NOTE: This is an optional semi-dynamic balance procedure that is provided for use based on the operators experience to obtain an optimized low pressure turbine balance. This procedure is optional to the dynamic balance procedure specified in Assembly-07 Task 72-53-00-400-007.

A. Prerequisites

(1) Install the turbine shaft to the low turbine module. Refer to Assembly-07 Task 72-53-00-400-007.

B. Equipment And Materials Required

Special Tools:

PWA 25096	Stand (Optional To PWA 87330)
PWA 28657	Sling
PWA 76154	Adapter (2 Required)
PWA 76270	Stand (Optional To PWA 87330)
PWA 85211	Weight, Balance (Rear Plane)
PWA 85221	Adapter, Lift And Trunnion
PWA 85232	Fixture, Angle Of Turn
PWA 85456	Retainer
PWA 85562	Sleeve, Support (Used With PWA 25096 Or PWA 76270 Stand)
PWA 85687	Weight, Calibration (For Balance Machines Without Electronic Calibration)
PWA 85883	Puller, Bearing (Optional To PWA 87261)
PWA 86420	Puller, Jackscrew (No. 4 Balance Bearing)
PWA 87261	Puller, Bearing
PWA 87330	Stand, Storage
PWA 87347	Sleeve, Support (Used With PWA 87330 Stand)
PWA 87382	Pulley, Drive
PWA 87752	Stand, Build
PWA 101545	Adapter, Drive

LOW PRESSURE TURBINE (LPT) − ASSEMBLY−11

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−045	Marker, Pen (PMC 4092)
P05−222	Tape (PMC 4278−1)
P05−223	Tape (PMC 4251)
P05−395	Beeswax
P05−396	Paraffin Wax Blend

C. Procedure

NOTE: After you balance the LPT and shaft assembly, you can not disassemble it unless you balance it again.

Subtask 72−53−00−430−076:

(1) Use a hoist to connect a PWA 28657 Sling, with two PWA 76154 Adapters, to the trunnion spools of the rear balance fixture. Lift the assembly from the build stand.

(2) Install a PWA 85221 Adapter to the front end of the turbine shaft. Connect a hoist to the adapter.

(3) Use both hoists to trunnion the assembly to the horizontal position.

(4) Place the turbine assembly on pedestals of a horizontal balance machine. Remove the hoist, sling, and adapters from the rear balance fixture. Remove the hoist and adapter from the front of the turbine shaft. See Figure 1001.

(5) Attach the drive belt to the front end of the turbine shaft.

(6) Put wax in the front ID of the turbine shaft to "null" out the shaft unbalance at the front end of the shaft. See Figure 1001.

(a) Locate the shaft unbalance and amount on the shaft OD in the recess just forward of the splines. The angular location is marked by a diamond symbol. The weight in oz. is marked next to the diamond symbol.

(b) Pan weigh an amount of Beeswax P05−395 or Paraffin Wax Blend P05−396 equal to the amount specified on the shaft OD.

(c) Put the wax at the same angular location and as close as possible to the front ID of the turbine shaft, about 1/2 inch (12.700 mm) from the shaft end. See Figure 1001.

(d) Trace the location of the wax with a Marker P05−045.

NOTE: The location of the wax will be used to reinstall the wax in the same location if you need to re−balance the turbine following installation of counterweights.

(7) Locate the "O" mark at the front end of the turbine shaft. Install Tape P05−222, with a small square of Silver Tape P05−223, around the shaft front journal, with the silver tape aligned with the "O" mark. Position the (timing) strobe light over the tape.

(8) An optional method to turn the turbine shaft is to use PWA 101545 Drive Adapter.

(a) Install the PWA 101545 Drive Adapter on the end of the turbine shaft.

(b) Remove the two hex nuts that attach the threaded puck to the chuck of the drive adapter and remove the threaded puck. Remove the master and put it back into the container.

(c) Install the threaded puck to the internal threads of the shaft. Thread the puck in the shaft until the outer face of the puck is in line with the outer most thread in the shaft.

(d) Install the drive adapter on the end of the shaft and align the "0" on the OD of the chuck with the "0" line marked on the end of the shaft. This is the "0" reference for balancing. Align the two holes in the end face with the two studs in the threaded puck.

(e) Rotate the threaded puck as necessary to allow the studs to pass through the chuck. Push the drive adapter on the shaft to engage the spline on the shaft. Make sure the internal guide assembly touches the end face of the step in the end of the shaft.

(f) Attach the chuck to the threaded puck with the two hex nuts. Tighten the nuts.

NOTE: The two studs of the threaded puck must not be above the outer face of the chuck when the drive adapter is fully installed on the shaft.

(g) Attach the balance machine to the PWA 101545 Drive Adapter.

(9) One more optional method to turn the turbine shaft is to use PWA 101545 Drive Adapter with PWA 87382 Drive Pulley.

(a) Install the PWA 87382 Drive Pulley to the end face of the drive adapter and align the holes in the drive pulley with the threaded holes in the drive adapter.

(b) Attach the pulley to the drive adapter with the eight bolts. Tighten the bolts.

(c) Attach a drive belt to the OD of the drive pulley.

Subtask 72−53−00−430−077:

(10) Calibrate balance machine to pull 4.0 oz−in. (2880 g.mm).

(a) For balance machines without electronic calibration, do a check of the static balance machine.

1 Install a PWA 85687 Calibration Weight, to a tierod, as close as possible to the heavy angle on the rear plane. Do not put the calibration weight on a tierod that has a counterweight. The calibration weight produces 4 oz−in. (2880 g.mm) of force when installed on the tierod.

2 The angle should agree with the residual unbalance within ± 30 degrees. The amount should agree within ± 0.4 oz−in. (288. g.mm) with the residual unbalance amount plus the pull value of the calibration weight.

3 Remove the calibration weight.

(b) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the static balance machine.

(11) Semi−dynamic Balance LPT assembly at 900 rpm minimum. Use the front (Plane W) and rear (Plane X). Record the unbalance and direction. See Figure 1002.

(12) The initial unbalance must not exceed 25 oz−in. (18000 g.mm). If necessary, the turbine shaft and/or the Stage 3 LPT airseal can be removed and rotated with respect to the turbine rotor to obtain the initial unbalance limit. Refer to Assembly−09 Task 72−53−00−400−009 to remove and rotate the turbine shaft and/or airseal.

Subtask 72−53−00−430−078:

(13) If the initial unbalance is within 25.0 oz−in. (18000. g.mm), you can balance the assembly by adding counterweights to the rear plane only to obtain the requirement of 1.0 oz−in. (720. g.mm).

CAUTION: DO NOT REMOVE ANY OF THE INSTALLED LPT MODULE (NON−COLORED) COUNTERWEIGHTS THAT WERE INSTALLED IN ASSEMBLY−04 TASK 72−53−00−400−004.

(a) If necessary, correct the unbalance at the rear, Plane X, with temporary spin−on PWA 85211 Balance Weights (counterweights). Thread the counterweights onto the 6th stage LPT disk tierods. Do not remove the tierod nuts.

(b) Add up to four counterweights maximum within ± 20 degrees of the unbalance vector. Fine trim by replacement of any of the four temporary spin on counterweights.

(c) If the unbalance is within the limits of 1.0 oz−in. (720. g.mm) the assembly is acceptable.

1 Calibrate the balance machine. Refer to Subtask 72-53-00-430-079.

2 Remove the assembly from the balance machine. Refer to Subtask 72-53-00-430-080.

3 Remove the temporary spin on counterweights and install colored (painted) engine parts as required. Refer to Subtask 72-53-00-430-081.

4 Remove the balance tooling and put the assembly in the storage stand. Refer to Subtask 72-53-00-430-082.

(d) If the unbalance is not within the balance limit, you can rotate the shaft and/or Stage 3 LPT airseal with respect to the turbine rotor and repeat the preceding procedure. Refer to Assembly-09 Task 72-53-00-400-009 to remove and rotate the turbine shaft and/or airseal.

Subtask 72-53-00-430-079:

(14) Calibrate balance machine to pull 4.0 oz-in. (2880 g.mm).

(a) For balance machines without electronic calibration, do a check of the static balance machine.

1 Install a PWA 85687 Calibration Weight, to a tierod, as close as possible to the heavy angle on the rear plane. Do not put the calibration weight on a tierod that has a counterweight. The calibration weight produces 4 oz-in. (2880 g.mm) of force when installed on the tierod.

2 The angle should agree with the residual unbalance within ± 30 degrees. The amount should agree within ± 0.4 oz-in. (288. g.mm) with the residual unbalance amount plus the pull value of the calibration weight.

3 Remove the calibration weight.

(b) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the static balance machine.

Subtask 72−53−00−430−080:

(15) Disconnect the drive belt from the forward end of the turbine shaft.

(16) If the turbine module must be removed from the turbine shaft add the following reference marks:

(a) Use a Marker P05−045 to make an alignment reference line across the turbine shaft flange and the 3rd stage airseal.

(b) Use a Marker P05−045 to make an alignment reference line across the 5th stage hub and the adjacent turbine shaft.

(17) Use a hoist to connect a PWA 28657 Sling, with two PWA 76154 Adapters, to the trunnion spools on the rear balance fixture.

(18) If the turbine module must be removed from the turbine shaft, use a Pen P05−045 to mark the outline of the temporary wax at the front ID of the turbine shaft. Remove the wax and put it in a suitable container.

NOTE: The wax must be removed before you install the lifting adapter to the front end of the turbine shaft. The wax must be put back in the same location if the assembly is balanced again.

(19) Install a PWA 85221 Lifting Adapter on the front end of the turbine shaft. Connect a second hoist to the adapter.

(20) Use both hoists to lift and trunnion the turbine assembly to the vertical, front end down, position. Remove the lower hoist and adapter from the turbine shaft. Lower the assembly into the PWA 87752 Build Stand.

(21) Remove the screws that hold the rear balance fixture to the turbine case. Use the hoist to remove the fixture. Remove the hoist, sling, and adapters.

(22) Remove the screws that hold the PWA 29952 Retaining Plate to the rear of the turbine shaft. Remove the retaining plate.

(23) Remove the rear balance bearing and spacer.

(a) Engage the locator detail of PWA 86420 Puller into the rear of the turbine shaft.

(b) Engage the three jaws through the openings in the bearing spacer. Move the jaws into position so that they touch the inner race of the bearing. Lock the jaws in position with the detail ring.

(c) Turn the bolt in a clockwise direction to remove the bearing and spacer.

(d) Remove the puller.

(24) If counterweights are not required, put the turbine and shaft assembly in the storage stand. Refer to Subtask 72−53−00−430−082. If counterweights are required in the rear plane only, refer to Subtask 72−53−00−430−081.

Subtask 72−53−00−430−081:

(25) If necessary, remove PWA 85211 Counterweights and install engine counterweights.

(a) Remove the temporary spin−on counterweights from tierods. Remove the tierod nut and spacer from the temporary counterweight locations.

(b) Assemble the same class colored (painted) engine counterweight to the tierod at the temporary counterweight locations.

(c) Treat the threads of the tierod and washer face of the nut with Engine Oil P03−001. Install the counterweights and nuts.

(d) Install PWA 85232 Angle Of Turn Fixture onto the 6th stage LPT disk. Align the bushings (1003/4) with the tierod nuts and position the plate (1003/2), with the stamped markings up, over the disk. See Figure 1003.

(e) (Reference 1251, 1252, or 1253) Torque nuts at the counterweight locations. Use a 0.500 inch square drive torque wrench installed in the socket over the dial indicator.

1 Apply initial torque of 140 − 160 lb−in. (15.818 − 18.078 N.m) to each nut.

CAUTION: THE FOLLOWING TORQUING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN MATING PARTS.

2 Loosen the nuts at the counterweight location.

3 Measure the torque necessary to turn the nut. If the measured torque is less than 50 lb−in. (5.469 N.m), then tighten to a torque of 45 lb−in. (5.084 N.m) plus or minus 5 lb−in. (0.565 N.m) and continue with the angle of turn.

4 If the measured torque is more than 50 lb−in. (5.649 N.m), find the torque necessary to turn the nut, add 15 lb−in. (1.695 N.m) plus or minus 5 lb−in. (0.565 N.m) to this torque. The total torque cannot be more than 100 lb−in. (11.298 N.m).

5 Apply the final angle of turn:

a (Reference 1251) (Pre SB PW4ENG 72−256) For engines with the 5th stage turbine hub PN 50N405, set the indicator dial (1003/7) to zero with the index mark (1003/5) on the fixture plate. Tighten the thumbscrew (1003/3) to set the indicator dial. Apply a 62 − 66 degree angle of turn.

NOTE: Use Reference 1251 for Phase−3 engines with CN after the engine SN (Post SB PW4ENG 72−572) that have 5th stage turbine hub PN 50N405.

b (Reference 1252) (Post SB PW4ENG 72−256) For engines with 5th stage turbine hub PN 50N505, set the indicator dial (1003/7) to zero, with the index mark (1003/5) on the fixture plate. Tighten the thumbscrew (1003/3) to set the indicator dial. Apply a 64 − 68 degree angle of turn.

NOTE: Use Reference 1252 for Phase−3 engines with CN after the engine SN (Post SB PW4ENG 72−572) that have 5th stage turbine hub PN 50N505.

c (Reference 1253) For engines with 5th stage turbine hub PN 51N305 and subsequent, set the indicator dial (1003/7) to zero, with the index mark (1003/5) on the fixture plate. Tighten the thumbscrew (1003/3) to set the indicator dial. Apply a 52 − 56 degree angle of turn.

NOTE: Use Reference 1253 for Phase−3 engines as built by P&W that have 5th stage turbine hub PN 51N305 and subsequent.

d Do this torque procedure, steps 1 through 5, again as applicable on all nuts at counterweight locations. Use the torque sequence numbers stamped on the fixture.

(f) Remove the angle of turn fixture.

(26) Balance the turbine and shaft assembly again, and correct the unbalance as necessary until the assembly is within the unbalance limits. Refer to (Subtask 72−53−00−430−076).

NOTE: If the unbalance limits can not be met, you can remove and replace the turbine shaft, or remove the turbine shaft and rotate it with respect to the turbine module. If you remove the turbine shaft, you must rebalance the LPT module and shaft assembly until the unbalance limits are met.

Subtask 72−53−00−430−082:

(27) Put the balanced turbine module with the shaft in the PWA 25096 Stand, PWA 76270 Stand or PWA 87330 Stand.

(a) Use a hoist to install a PWA 28657 Sling and two PWA 86206 Adapters to the rear retainer at the trunnion spools labeled "LPT WITH SHAFT".

(b) Remove the bolts that hold the front flange of the turbine case to the balance fixture.

(c) Install the PWA 85456 Retainer to the front flange of the turbine case. See Figure 1004.

1 Lift the assembly from the stand.

2 Align the center hole in the retainer with the dowel pin (case 6 o'clock position) in the turbine case. Use the four detail bolts (1004/2) and nuts (1004/1) to hold the retainer details to the front flange of the turbine case at the 6 and 12 o'clock locations.

3 Install two bolts (1004/3) to hold the retainer to the turbine shaft.

(d) Install PWA 85221 Adapter to the front end of the turbine shaft. Attach a second hoist to the eye.

(e) Lift the assembly from the stand and trunnion to the horizontal position.

(f) If they are not there, install PWA 85562 Support Sleeve into the shaft support cradles of PWA 25096 Stand, PWA 76270 Stand or PWA 87347 Support Sleeve into the shaft support cradles of PWA 87330 Stand. Put details−1 and −2 at the forward cradle and the details−3 and −4 at the rear cradle. Tighten the set screws to attach the sleeves to the cradles. See Figure 1005.

(g) Use the hoists to put the assembly in the stand.

(h) Slide the chocks at the rear of the stand inward to contact the case OD. Adjust the shaft position, as necessary, so that the front face of the rear, Flange P, rests against the rear face of the chock. Secure the shaft to the stand with the detail clamps.

NOTE: The chocks are used as safety device and do not support any portion of the assembly.

(i) Remove the hoist and adapter from the front end of the turbine shaft. Remove the hoist, sling, and adapters from the rear retainer.

(28) Use a PWA 85883 Puller or PWA 87261 Puller to remove the front balance bearing.

(a) Engage the adapter assembly in the front end of the turbine shaft.

(b) Move the jaws into position so that they touch the inner race of the bearing.

(c) Lock the jaws in position with the detail ring.

(d) Turn the bolt in a clockwise direction to remove the bearing.

Task 72-53-00-400-012:

1. Dynamic Balance The Low Pressure Turbine With Shaft (Balance Procedure)

NOTE: This is a dynamic balance procedure that is provided for use based on the operators experience to obtain an optimized low pressure turbine balance. This procedure can be done in place of the Assembly-03 Task 72-53-00-400-003 balance of the low pressure turbine. If this procedure is not done, Assembly-03 Task 72-53-00-400-003 must be done.

NOTE: It is necessary to have a stage 3 LPT rotating airseal, with a balancing counterweight flange, installed in the module to do this balance procedure.

A. Prerequisites

(1) Install the turbine shaft to the low turbine module. Refer to Assembly-07 Task 72-53-00-400-007.

B. Equipment And Materials Necessary

Special Tools:

PWA 25096	Stand, Storage (Optional To PWA 87330)
PWA 25527	Stand, Storage (Optional To PWA 87330 For Moving The Turbine With The Balance Fixture Installed)
PWA 28375	Riveter
PWA 28657	Sling
PWA 76154	Adapter (2 Required)
PWA 76270	Stand (Optional To PWA 87330)
PWA 76855	Pump, Hydraulic
PWA 85211	Weight, Balance (Rear Plane)
PWA 85221	Adapter, Lift And Trunnion
PWA 85232	Fixture, Angle Of Turn
PWA 85456	Retainer
PWA 85562	Sleeve, Support (Used With PWA 25096 Or PWA 76270 Stand)
PWA 85687	Weight, Calibration (Rear) (Check Weight)
PWA 85883	Puller,Bearing (Optional To PWA 87261)
PWA 86420	Puller, Jackscrew (No. 4 Balance Bearing)
PWA 86302	Bender, Hydraulic
PWA 86549	Ring, Adapter
PWA 86622	Weight, Calibration (Front) (Check Weight)
PWA 87261	Puller, Bearing

Special Tools:

(CONTINUED)

PWA 87330	Stand, Storage/Transport
PWA 87346	Post, Support
PWA 87347	Sleeve, Support (Used With PWA 87330 Stand)
PWA 87382	Pulley, Drive
PWA 87752	Stand, Build
PWA 101545	Adapter, Drive

Consumable Materials:

Item No.	Designation

Counterweight	0 − 4	72−53−00/6/110

C. Procedure

NOTE: After you balance the LPT and shaft assembly, you can not disassemble it unless you balance it again.

Subtask 72−53−00−430−083:

(1) Use a hoist to connect a PWA 28657 Sling, with two PWA 76154 Adapters, to the trunnion spools of the rear balance fixture. Lift the assembly from the build stand.

(2) Install a PWA 85221 Adapter to the front end of the turbine shaft. Connect a hoist to the adapter.

(3) Use both hoists to trunnion the assembly to the horizontal position.

(4) If necessary, you can move the turbine with PWA 87330 Stand.

NOTE: See the following step to move the the turbine with the PWA 25527 Stand.

(a) Use the detail ball lock pins to attach PWA 87346 Support Post to the longer end of the PWA 87330 Stand.

(b) Put the turbine assembly over the stand, and align the shaft and rear balance fixture rear diameter with the mating stand and post cradles.

(c) Lower the turbine assembly onto the stand and support post. Close the clamps, and tighten the hand knobs.

(d) Remove the hoists, slings, and adapters.

(5) If necessary, you can move the turbine with PWA 25527 Stand.

(a) Put the turbine assembly over the stand.

(b) Install PWA 86416 Adapter Ring on the front balance fixture, with the two bolts, so that the ring touches the cradle on the stand.

(c) Lower the turbine assembly onto the stand. Remove the hoists, slings, and adapters.

(6) If necessary, remove the assembly from the stand. Use a hoist to connect a PWA 28657 Sling, with two PWA 76154 Adapters, to the trunnion spools of the rear balance fixture; and connect a hoist to the adapter at the front end of the turbine shaft.

(7) Place the turbine assembly on pedestals of a horizontal balance machine. Remove the hoist, sling, and adapters from the rear balance fixture. Remove the hoist and adapter from the front of the turbine shaft.

(8) Attach the drive belt to the front end of the turbine shaft. See Figure 1001.

(9) Put wax in the front ID of the turbine shaft to "null" out the shaft unbalance at the front end of the shaft. See Figure 1001.

(a) Locate the shaft unbalance and amount on the shaft OD in the recess just forward of the splines. The angular location is marked by a symbol (the Letter L within a circle). The weight in oz. is marked next to this symbol.

(b) Pan weigh an amount of Beeswax P05−395 or Paraffin Wax Blend P05−396 equal to the amount specified on the shaft OD.

(c) Put the wax at the same angular location and as close as possible to the front ID of the turbine shaft, about 1/2 inch (12.700 mm) from the shaft end as shown in the referenced figure.

(d) Trace the location of the wax with a Marker P05−045.

NOTE: The location of the wax will be used to reinstall the wax in the same location if you need to rebalance the turbine following installation of counterweights.

(10) Locate the "O" mark at the front end of the turbine shaft. Install Tape P05−222 around the shaft front journal. Install a small square of Silver Tape P05−223 on the Tape P05−222 aligned with the "O" mark at the front end of the turbine shaft. Position the (timing) strobe light over the silver tape.

(11) An optional method to turn the turbine shaft is to use PWA 101545 Drive Adapter.

(a) Install the PWA 101545 Drive Adapter on the end of the turbine shaft.

(b) Remove the two hex nuts that attach the threaded puck to the chuck of the drive adapter and remove the threaded puck. Remove the master and put it back into the container.

(c) Install the threaded puck to the internal threads of the shaft. Thread the puck in the shaft until the outer face of the puck is in line with the outer most thread in the shaft.

(d) Install the drive adapter on the end of the shaft and align the "0" on the OD of the chuck with the "0" line marked on the end of the shaft. This is the "0" reference for balancing. Align the two holes in the end face with the two studs in the threaded puck.

(e) Rotate the threaded puck as necessary to allow the studs to pass through the chuck. Push the drive adapter on the shaft to engage the spline on the shaft. Make sure the internal guide assembly touches the end face of the step in the end of the shaft.

(f) Attach the chuck to the threaded puck with the two hex nuts. Tighten the nuts.

NOTE: The two studs of the threaded puck must not be above the outer face of the chuck when the drive adapter is fully installed on the shaft.

(g) Attach the balance machine to the PWA 101545 Drive Adapter.

(12) One more optional method to turn the turbine shaft is to use PWA 101545 Drive Adapter with PWA 87382 Drive Pulley.

(a) Install the PWA 87382 Drive Pulley to the end face of the drive adapter and align the holes in the drive pulley with the threaded holes in the drive adapter.

(b) Attach the pulley to the drive adapter with the eight bolts. Tighten the bolts.

(c) Attach a drive belt to the OD of the drive pulley.

Subtask 72−53−00−430−084:

(13) Operate the dynamic balance machine.

(a) Find the dynamic unbalance of the low pressure turbine and shaft assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(14) Remove the PWA 101545 Drive Adapter and the PWA 87382 Drive Pulley from the shaft as follows:

(a) Make a reference mark on the drive adapter, the drive pulley and the shaft with a Marker P05−045 to identify the original location.

(b) Remove the drive belt from the OD of the drive pulley. Remove the bolts that attach the drive pulley to the drive adapter.

(c) Remove the two nuts that attach the chuck of the drive adapter to the threaded puck. Remove the chuck, turn it 180 degrees from the original location and install it on the shaft. Attach the chuck to the threaded puck with the two nuts.

(d) Install the drive pulley 180 degrees from the original location, align the bolt holes and attach with the eight detail bolts. Tighten the bolts.

(e) Attach a drive belt to the OD of the PWA 87382 Drive Pulley.

(15) Dynamic balance the low pressure turbine and shaft assembly. See Figure 1002 and Figure 1004.

(a) Find the dynamic unbalance of the low pressure turbine and shaft assembly while the assembly turns at 900 rpm minimum.

(b) The initial unbalance must not exceed 25.0 oz−in. (18000.0 g.mm) in Plane AS and 25.0 oz−in. (18000.0 g.mm) in Plane AT, OR must not be more than 12.5 oz−in. (9000.0 g.mm) in Plane AS and 12.5 oz−in. (9000.0 g.mm) in Plane AT if the unbalance vectors are within 30 degrees of each other.

(c) If necessary, to get the initial balance requirements, the turbine shaft and the Stage 3 LPT airseal can be rotated in 90 degree increments until you get the initial unbalance requirements. Refer to Assembly−09 Task 72−53−00−400−009 to remove and rotate the turbine shaft and/or airseal.

(d) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(e) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(16) Balance the assembly to get a remaining unbalance of 1.0 oz−in. (720.0 g.mm) maximum in the front, Plane AS, and the rear, Plane AT.

(a) Residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm) maximum in the front, Plane AS.

NOTE: If applicable, the counterweights installed during the optional balance procedure for the low pressure turbine assembly per 72−53−00, Assembly−03 Task 72−53−00−400−004 ARE NOT to be removed.

1 Correct the residual unbalance in the front plane, Plane AS, by adding any combination of counterweights up to a maximum of six in ± 45 degrees of the unbalance vector.

2 Install the counterweights and rivets to the rivet holes in the 3rd stage airseal flange and hold in position with Pressure Sensitive Sealing Tape P05−323.

(b) Residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm) maximum in the rear, Plane AT.

NOTE: If applicable, the counterweights installed during the optional balance procedure for the low pressure turbine assembly per 72−53−00, Assembly−03 Task 72−53−00−400−004 ARE NOT to be removed.

1 Correct the residual unbalance in the rear plane, Plane AT, by adding any class of the PWA 85211 Balance Weight (1002/4) up to a maximum of four in ± 20 degrees of the unbalance vector.

2 Install the balance weights (1002/4) to the tierods (1002/3) that attach the 6th stage disk.

NOTE: Do not remove the tierod nuts (1002/2).

Subtask 72−53−00−430−085:

(17) If necessary, trim balance clip on counterweights can be added to the 6th stage blade tips to fine trim the residual unbalance of 1.0 oz−in. (720.0 g.mm) maximum in the rear plane.

NOTE: Trim balance clip−on counterweights pull approximately 4.3 oz−in. (3096 g.mm). Clip on counterweights do not have a significant affect on the balance on the front plane.

(a) If necessary, correct by adding up to a maximum of ten PN 50N401 balance correction weights (clip−on), OR up to a maximum of four PN 50N411 balance correction weights (clip−on), at the outer end of the 6th stage LPT blades (1002/5). The total trim balance weights must not be more than 10 weights maximum.

(b) If applicable, position clip−on counterweight to the flat outboard end of the 6th stage blade. Engage the leg of the counterweight with the leading edge of the blade. See Figure 1003.

CAUTION: THE LEG OF THE COUNTERWEIGHT MUST BE ENGAGED WITH THE LEADING EDGE OF THE BLADE WHEN YOU BEND THE LOCKING FLAP.

(c) If necessary, use PWA 76855 Hydraulic Pump with PWA 86302 Bender to attach the clip−on counterweight. Position the bender tool to the counterweight and apply slight pressure, pulling toward the operator to hold the weight in position. Bend the locking flap to hold the counterweight in position.

(18) Record the angle and the amount of assembly unbalance in the front and rear planes.

Subtask 72−53−00−430−087:

(19) Optional process based on the experience of the operator, do a check of the dynamic balance machine as follows:

(a) Install the front plane PWA 86622 Calibration Weight (Check Weight) to the rivet hole in the 3rd stage airseal flange as close as possible to the heavy angle.

NOTE: Do not install a check weight at a location where a counterweight is installed.

(b) Turn the dynamic balance machine at 900 rpm minimum. Check the machine, with the check weight installed in the front plane.

1 The check weight on the front plane pulls 4.0 oz−in. (2880.0 g.mm).

2 Read the angle and the amount of assembly unbalance in the front plane.

3 The amount of unbalance in the front plane should agree in ± 0.4 oz−in. (288.0 g.mm) or less with the amount recorded when the assembly was balanced.

4 Remove the check weight from the front plane.

(c) Install the rear plane PWA 85687 Calibration Weight (Check Weight) to a tierod, as close as possible to the heavy angle, that attaches the 6th stage disk. Do not remove the tierod nut.

(d) Turn the dynamic balance machine at 900 rpm minimum. Check the machine, with the check weight installed in the rear plane.

1 The check weight on the rear plane pulls 4.0 oz−in. (2880.0 g.mm).

2 Read the angle and the amount of assembly unbalance in the rear plane.

3 The amount of unbalance in the rear plane should agree in ± 0.4 oz−in. (288.0 g.mm) or less with the amount recorded when the assembly was balanced.

4 Remove the check weight from the rear plane.

(e) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the dynamic balance machine.

Subtask 72−53−00−430−088:

(20) Disconnect the drive belt from the forward end of the turbine shaft.

(21) Use a hoist to connect a PWA 28657 Sling, with two PWA 76154 Adapters, to the trunnion spools on the rear balance fixture.

(22) Install a PWA 85221 Lifting Adapter on the front end of the turbine shaft. Connect a second hoist to the adapter.

(23) Use both hoists to lift and trunnion the turbine assembly to the vertical, front end down, position. Remove the lower hoist and adapter from the turbine shaft. Lower the assembly into the PWA 87752 Build Stand.

(24) Remove the screws that hold the rear balance fixture to the turbine case. Use the hoist to remove the fixture. Remove the hoist, sling, and adapters.

(25) Remove the screws that hold the PWA 29952 Retaining Plate to the rear of the turbine shaft. Remove the retaining plate.

(26) Remove the rear balance bearing and spacer.

  (a) Engage the locator detail of PWA 86420 Puller into the rear of the turbine shaft.

  (b) Engage the three jaws through the openings in the bearing spacer. Move the jaws into position so that they touch the inner race of the bearing. Lock the jaws in position with the detail ring.

  (c) Turn the bolt in a clockwise direction to remove the bearing and spacer.

  (d) Remove the puller.

(27) If rear plane counterweights are not required, put the turbine and shaft assembly in the storage stand. Refer to Subtask 72−53−00−430−090. If counterweights are required, procede as follows:

  (a) If counterweights are required in the front, Plane AS, they will be installed after the turbine is put on the storage stand. Refer to Subtask 72−53−00−430−091.

  (b) If counterweights are required in the rear, Plane X, refer to Subtask 72−53−00−430−089.

Subtask 72−53−00−430−089:

(28) If necessary, remove PWA 85211 Counterweights and install engine counterweights.

  (a) Remove the temporary spin−on counterweights from tierods. Remove the tierod nut and spacer from the temporary counterweight locations.

  (b) Assemble the same class colored (painted) engine counterweight to the tierod at the temporary counterweight locations.

  (c) Treat the threads of the tierod and washer face of the nut with Engine Oil P03−001. Install the counterweights and nuts.

(d) Install PWA 85232 Angle Of Turn Fixture onto the 6th stage LPT disk. Align the bushings (1005/4) with the tierod nuts and position the plate (1005/2), with the stamped markings up, over the disk. See Figure 1005.

(e) (Reference 1251, 1252, or 1253) Torque nuts at the counterweight locations. Use a 0.500 inch square drive torque wrench installed in the socket over the dial indicator.

1 Apply initial torque of 140 - 160 lb-in. (15.818 - 18.078 N.m) to each nut.

CAUTION: THE FOLLOWING TORQUING PROCEDURE MUST BE ACCOMPLISHED WITH MAXIMUM TEMPERATURE DIFFERENTIAL OF 40°F (22.2°C) BETWEEN MATING PARTS.

2 Loosen the nuts at the counterweight location.

3 Measure the torque necessary to turn the nut. If the measured torque is less than 50 lb-in. (5.469 N.m), then tighten to a torque of 45 lb-in. (5.084 N.m) plus or minus 5 lb-in. (0.565 N.m) and continue with the angle of turn.

4 If the measured torque is more than 50 lb-in. (5.649 N.m), find the torque necessary to turn the nut, add 15 lb-in. (1.695 N.m) plus or minus 5 lb-in. (0.565 N.m) to this torque. The total torque cannot be more than 100 lb-in. (11.298 N.m).

5 Apply the final angle of turn:

a (Reference 1251) (Pre SB PW4ENG 72-256) For engines with the 5th stage turbine hub PN 50N405, set the indicator dial (1005/7) to zero with the index mark (1005/5) on the fixture plate. Tighten the thumbscrew (1005/3) to set the indicator dial. Apply a 62 - 66 degree angle of turn.

NOTE: Use Reference 1251 for Phase -3 engines with CN after the engine SN (Post SB PW4ENG 72-504) that have 5th stage turbine hub PN 50N405.

b (Reference 1252) (Post SB PW4ENG 72-256) For engines with 5th stage turbine hub PN 50N505, set the indicator dial (1005/7) to zero, with with the index mark (1005/5) on the fixture plate. Tighten the thumbscrew (1005/3) to set the indicator dial. Apply a 64 - 68 degree angle of turn.

NOTE: Use Reference 1252 for Phase -3 engines with CN after the engine SN (Post SB PW4ENG 72-504) that have 5th stage turbine hub PN 50N505.

c (Reference 1253) For engines with 5th stage turbine hub PN 51N305 and subsequent, set the indicator dial (1005/7) to zero, with the index mark (1005/5) on the fixture plate. Tighten the thumbscrew (1005/3) to set the indicator dial. Apply a 52 - 56 degree angle of turn.

NOTE: Use Reference 1253 for Phase -3 engines as built by P&W that have 5th stage turbine hub PN 51N305 and subsequent.

6 Do this torque procedure, steps 1 through 5, again as applicable on all nuts at counterweight locations. Use the torque sequence numbers stamped on the fixture.

(f) Remove the angle of turn fixture.

Subtask 72-53-00-430-090:

(29) Put the balanced turbine module with the shaft in the PWA 25096 Stand, PWA 76270 Stand or PWA 87330 Stand.

(a) Use a hoist to install a PWA 28657 Sling and two PWA 86206 Adapters to the rear retainer at the trunnion spools labeled "LPT WITH SHAFT".

(b) Remove the bolts that hold the front flange of the turbine case to the balance fixture.

(c) Install the PWA 85456 Retainer to the front flange of the turbine case. See Figure 1006.

1 Lift the assembly from the stand.

2 Align the center hole in the retainer with the dowel pin (case 6 o'clock position) in the turbine case. Use the four detail bolts (1006/2) and nuts (1006/1) to hold the retainer details to the front flange of the turbine case at the 6 and 12 o'clock locations.

3 Install two bolts (1006/3) to hold the retainer to the turbine shaft.

(d) Install PWA 85221 Adapter to the front end of the turbine shaft. Attach a second hoist to the eye.

(e) Lift the assembly from the stand and trunnion to the horizontal position.

(f) If they are not there, install PWA 85562 Support Sleeve into the shaft support cradles of PWA 25096 Stand, PWA 76270 Stand or PWA 87347 Support Sleeve into the shaft support cradles of PWA 87330 Stand. Put details−1 and −2 at the forward cradle and the details−3 and −4 at the rear cradle. Tighten the set screws to attach the sleeves to the cradles. See Figure 1007.

(g) Use the hoists to put the assembly in the stand.

(h) Slide the chocks at the rear of the stand inward to contact the case OD. Adjust the shaft position, as necessary, so that the front face of the rear, Flange P, rests against the rear face of the chock. Secure the shaft to the stand with the detail clamps.

NOTE: The chocks are used as safety devices and do not support any portion of the assembly.

(i) Remove the hoist and adapter from the front end of the turbine shaft. Remove the hoist, sling, and adapters from the rear retainer.

R (j) Remove the tape or wax to that was used cancel
R out the shaft unbalance at the front ID of the
R shaft.

(30) Use a PWA 85883 or PWA 87261 Puller to remove the front balance bearing.

(a) Engage the adapter assembly in the front end of the turbine shaft.

(b) Move the jaws into position so that they touch the inner race of the bearing.

(c) Lock the jaws in position with the detail ring.

(d) Turn the bolt in a clockwise direction to remove the bearing.

Subtask 72−53−00−430−091:

(31) As necessary, attach the applicable counterweights with rivets to the correct rivet hole(s) in the scalloped counterweight flange of the Stage 3 LPT (rotating) airseal. Use PWA 28375 Riveter to flare the rivets.

LOW PRESSURE TURBINE (LPT) - STORAGE-01

Task 72-53-00-530-001:

1. Pack Low Pressure Turbine (LPT)

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 85331 Retainer, Rear
PWA 85332 Fixture, Handling (Optional To PWA 86206)
PWA 85635 Adapter, Lifting
PWA 86026 Fixture, Handling
PWA 86206 Adapter (2 Required, Used With PWA 85331)

Consumable Materials:

NOTE: The following items not normally supplied by the container manufacturer.

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-156	Seal, Lead
P15-001	Dehydrater

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995-C41				

Packing Equipment:

NOTE: The following table lists assembly number, dimensions and gross weight for low pressure turbine shipping container available from Pratt & Whitney. Further information can be obtained from:

Commercial Parts Support
Commercial Engine Business
Pratt & Whitney
400 Main St.
East Hartford, CT 06108

Container Assembly No.	Dimensions	Approximate Gross Weight Including Low Pressure Turbine
P60039	73 Inch (1854.200 mm) x 73 Inch (1854.200 mm) x 61 Inch (1549.400 mm)	2,166 lbs (982.48 Kg)

B. Procedure

(1) If applicable, install PWA 85332 (Optional to PWA 86026) Handling Fixture. See Figure 1201.

NOTE: See the following step for installation of the optional Handling Fixture (PWA 86026).

(a) Place the Fixture (PWA 85332) front (lug end) down, on the work table. Attach the plate detail of PWA 85635 Lifting Adapter to the fixture with the four bolts provided. If it is not there, install an eyebolt in the 0.500−13 tapped hole in the arm. Attach a hoist to the eyebolt and a hoist to the shackle detail of the lifting adapter.

(b) Install the conical locator into one of the tierod holes in the ID flange of the 5th stage turbine rear hub.

NOTE: The locator aligns the tierod holes in the turbine hub with the handling fixture.

(c) Lift the fixture and put it over the turbine rear hub. Align locator detail in the turbine hub with a lug detail in the handling fixture body. Lower the fixture until it touches the rear face of the 5th stage rear turbine hub.

(d) Use two Handle T rods, to slide the lockring rearward to expand the clamps. Attach the lockring with four screws, so that the clamps interface with turbine rear hub bore.

(e) Remove the lifting adapter from the handling fixture. Remove the hoists.

(2) Install PWA 86026 Handling Fixture (Optional to PWA 85332).

(a) Install the conical locator into one of the tierod holes in the ID flange of the 5th stage turbine rear hub.

NOTE: the locator aligns the tierod holes in the turbine hub with the handling fixture.

(b) Place the Fixture (PWA 86026) front (lug end) down, on the work table. Attach the plate detail of PWA 85635 Lifting Adapter to the fixture with the four bolts provided. If it is not there, install an eyebolt in the 0.500−13 tapped hole in the arm. Attach a hoist to the eyebolt and a hoist to the shackle detail of the lifting adapter.

(c) Use the template detail to measure the 5th stage hub flange thickness. If the flange thickness is 0.680 inch (17.272 mm), install the detail−17 spacer to the Fixture (PWA 86026). If the flange thickness is 0.813 inch (20.650 mm) the detail−17 spacer is not necessary.

(d) Lift the fixture and put it over the turbine rear hub. Align the locator detail in the turbine hub with a lug detail in the handling fixture body. Lower the fixture until it touches the rear face of the 5th stage rear turbine hub.

(e) Tighten the four detail hex head screws, one at a time until the four detail supports are correctly engaged at the turbine hub bore and the four detail arms are correctly engaged in the step provided in the detail body.

(f) Remove the lifting adapter from the handling fixture. Remove the hoists.

(3) Install PWA 85331 Rear Retainer (1202/2). See Figure 1202.

(a) Use a hoist to connect a suitable sling to the two eyebolts installed in two 0.500−13 lift holes marked "FOR LIFTING TOOL VERTICALLY ONLY".

(b) Lift and position the retainer over the previously installed handling fixture and attach it to the case with 48 screws (1202/5) and washers (1202/4).

(c) Lock the axial position of LPT rotor by tightening eight hand knobs (1202/3) against the handling fixture.

(4) Use a hoist to attach Sling PWA 28657 and two PWA 86206 Adapters to the rear retainer at spools labeled LPT WITHOUT SHAFT. See Figure 1002.

(5) Remove the top half of P60039 Container Assembly. See Figure 1203.

  (a) Open the manual pressure relief valve on the cover to relieve any pressure from the container.

  (b) Loosen the nuts on the "T" head bolts to permit the "T" heads to be rotated 90 degrees and pass through the slots in the cover flange.

  NOTE: Do not remove the lockwashers and nuts from the bolts.

  (c) Install nylon lifting straps to the lifting eyes of the cover. Use two hoists to remove the top cover from the container. Remove the hoists from the straps.

(6) Use the hoist to position the turbine, front end down, over P60039 Container Assembly. Align the two dowel pins in the lower support (1203/5) of the container with the boltholes in the lower flange of the LPT case.

(7) Attach the case to the container with 26 detail flat washers, lock washers, and bolts (1203/4).

(8) Remove the Retainer (PWA 85331). See Figure 1202.

  (a) Loosen eight hand knobs (1202/3) of the retainer (1202/2).

  (b) Remove 48 washers (1202/4) and bolts (1202/5) that attach the retainer to the rear flange of the turbine case.

  (c) Install two eyebolts into the two 0.500−13 tapped holes on rear side of retainer labeled "FOR LIFTING TOOL VERTICAL ONLY".

  (d) Use a hoist to connect a suitable sling to the eyebolts.

  (e) Use the hoist to remove the retainer. Remove the hoist, sling, and eyebolts.

(9) Remove the Handling Fixture (PWA 85332). See Figure 1201.

NOTE: See the following step for removal of the optional Handling Fixture (PWA 86026).

(a) Attach the plate detail of PWA 85635 Lifting Adapter to the fixture with the four bolts provided. If it is not there, install an eyebolt in the 0.500−13 tapped hole in the arm. Attach a hoist to the eyebolt and a hoist to the shackle detail of the lifting adapter.

(b) Remove the four screws that attach the detail lockring.

(c) Use two Handle T rods, to slide the lockring forward to retract the clamp details.

(d) Remove the lifting adapter from the handling fixture. Remove the hoists.

(10) Remove the Handling Fixture (PWA 86026). See Figure 1201.

(a) Attach the plate detail of Lifting Adapter (PWA 85635) to the fixture with the four bolts provided. If it is not there, install an eyebolt in the 0.500−13 tapped hole in the arm. Attach a hoist to the eyebolt and a hoist to the shackle detail of the lifting adapter.

(b) Loosen the four detail hex head screws, one at a time to retract the four detail supports to remove the fixture from the turbine hub.

(c) Remove the lifting adapter from the handling fixture. Remove the hoists.

(11) Use a suitable sling to lift and put the upper support (1202/3) of the container over the turbine case rear flange. Align the bolthole in the center of the upper and lower support plates. Attach the supports with the detail lock washer (1203/2) and bolt (1203/1) threads lubricated with Engine Oil (P03−001). Torque the bolt to 2300 − 2400 lb−in. (259.865 − 271.164 N.m).

(12) Connect a hoist to the lifting rings on the top cover of the container, and position the top cover over the

bottom of the container. Align the dowel pins with the dowel pin holes and lower the top cover onto bottom half of the container.

(13) Attach the top cover to the bottom half with the detail bolts and nuts.

(14) Install lockwire, MS20995−C41 through holes in the cover flange and attach a Lead Seal (P05−156). Use a bull dog pliers to compress the seal on the wire and cutoff the excess wire.

(15) Inspect the condition of Dehydrater (P15−001) and replace as required.

Task 72−53−00−540−001:

2. Unpack Low Pressure Turbine (LPT)

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 85331 Retainer,Rear
PWA 85332 Fixture, Handling (Optional To PWA 86206)
PWA 85576 Stand, Storage
PWA 85635 Adapter, Lifting
PWA 86026 Fixture, Handling
PWA 86206 Adapter (2 Required, Used With PWA 85331)

B. Procedure

(1) Break and remove the lockwire and seal from the container flange.

(2) Remove the top half of P60039 Container Assembly. See Figure 1203.

(a) Open the manual pressure relief valve on the cover to relieve any pressure from the container.

(b) Loosen the nuts on the "T" head bolts to permit the "T" heads to be rotated 90 degrees and pass through the slots in the cover flange.

NOTE: Do not remove the lockwashers and nuts from the bolts.

(c) Install nylon lifting straps to the lifting eyes of the cover. Use two hoists to remove the top cover from the container. Remove the hoists from the straps.

(3) Loosen and remove the center bolt (1203/1) and lockwasher (1203/2) which attach the upper support (1203/3) to the low pressure turbine and the lower support. Attach two nylon lifting straps to two of the four spokes 180 degrees apart on the upper support. Use a hoist to carefully raise and remove the upper support from the low pressure turbine assembly. Place the removed upper support on a bench or table and remove the hoists.

(4) If applicable, install PWA 85332 (Optional to PWA 86026) Handling Fixture. See Figure 1201.

NOTE: See the following step for installation of the optional Handling Fixture (PWA 86026).

(a) Place the Fixture (PWA 85332) front (lug end) down, on the work table. Attach the plate detail of PWA 85635 Lifting Adapter to the fixture with the four bolts provided. If it is not there, install an eyebolt in the 0.500−13 tapped hole in the arm. Attach a hoist to the eyebolt and a hoist to the shackle detail of the lifting adapter.

(b) Install the conical locator into one of the tierod holes in the ID flange of the 5th stage turbine rear hub.

NOTE: The locator aligns the tierod holes in the turbine hub with the handling fixture.

(c) Lift the fixture and put it over the turbine rear hub. Align the locator detail in the turbine hub with a lug detail in the handling fixture body. Lower the fixture until it touches the rear face of the 5th stage rear turbine hub.

(d) Use two Handle T rods, to slide the lockring rearward to expand the clamps. Attach the lockring with four screws, so that the clamps interface with turbine rear hub bore.

(e) Remove the lifting adapter from the handling fixture. Remove the hoists.

(5) Install PWA 86026 Handling Fixture (Optional to PWA 85332).

(a) Place the Fixture (PWA 86026) front (lug end) down, on the work table. Attach the plate detail of Lifting Adapter (PWA 85635) to the fixture with the four bolts provided. If it is not there, install an eyebolt in the 0.500−13 tapped hole in the arm. Attach a hoist to the eyebolt and a hoist to the shackle detail of the lifting adapter.

(b) Use the template detail to measure the 5th stage hub flange thickness. If the flange thickness is 0.680 inch (17.272 mm), install the detail−17 spacer to the Fixture (PWA 86026). If the flange thickness is 0.813 inch (20.650 mm) the detail−17 spacer is not necessary.

(c) Install the conical locator into one of the tierod holes in the ID flange of the 5th stage turbine rear hub.

NOTE: The locator aligns the tierod holes in the turbine hub with the handling fixture.

(d) Lift the fixture and put it over the turbine rear hub. Align the locator detail in the turbine hub with a lug detail in the handling fixture body. Lower the fixture until it touches the rear face of the 5th stage rear turbine hub.

(e) Tighten the four detail hex head screws, one at a time until the four detail supports are correctly engaged at the turbine hub bore and the four detail arms are correctly engaged in the step provided in the detail body.

(6) Install PWA 85331 Rear Retainer. See Figure 1202.

(a) Use a hoist to connect a suitable sling to the two eyebolts installed in two 0.500−13 lift holes marked "FOR LIFTING TOOL VERTICALLY ONLY".

(b) Lift and position the retainer over the previously installed handling fixture and attach it to the case with 48 screws (1202/5) and washers (1202/4).

(c) Lock axial position of LPT rotor by tightening eight hand knobs (1202/3) against the handling fixture.

(7) Remove the 26 bolts, lockwashers, and flat washers (1203/4) that attach the case flange to the container lower support (1203/5).

(8) Use a hoist to attach Sling (PWA 28657) and two PWA 86206 Adapters to the rear retainer at spools labeled LPT WITHOUT SHAFT.

(9) Use the hoist to carefully lift the assembly from the container and position it in PWA 85576 Storage Stand.

(10) Remove the hoist and sling and adapters from the retainer.

(Task 72−53−00−530−001)

LOW PRESSURE TURBINE (LPT) - STORAGE-02

Task 72-53-00-530-002:

1. Pack Low Pressure Turbine (LPT) With Shaft

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 76154 Adapters (Two Required)

Consumable Materials:

NOTE: The following items not normally supplied by container manufacturer.

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-156	Seal, Lead
P15-001	Dehydrater

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Lockwire, MS20995-C41				

Packaging Equipment:

NOTE: The following table lists assembly number, dimensions, and gross weight for low pressure turbine shipping container available from Pratt & Whitney. Further information can be obtained from:

Commercial Parts Support
Commercial Engine Business
Pratt & Whitney
400 Main St.
East Hartford, CT 06108

Container Assembly No.	Dimensions	Approximate Gross Weight Including Low Pressure Turbine
P60043	134.3 Inch (3411.220 mm) x 87.6 Inch (2225.040 mm) x 64.0 Inch (1625.600 mm)	3,671 lbs (1665.14 Kg)

B. Procedure

(1) If it is there, remove the Retainer (PWA 85331) from the low pressure turbine. See Figure 1201.

  (a) Loosen the eight hand knobs (1201/4) of the retainer (1201/5).

  (b) Remove 48 screws (1201/7) and washers (1201/6) that hold the retainer to the rear flange of the turbine case.

  (c) Use a hoist to connect a suitable sling to the hoist ring details of the fixture.

  (d) Use the hoist to remove the retainer. Remove the hoist and sling.

  (e) Remove the bolts (1201/2) that attach the Adapter (PWA 85430 or PWA 86424) (1201/1) to the turbine shaft. Remove the adapter.

(2) Remove the top half of P60043 Container Assembly.

  (a) Open the manual pressure relief valve on the cover to relieve any pressure from the container.

  (b) Loosen the nuts on the "T" head bolts to permit the "T" heads to be rotated 90 degrees and pass through the slots in the cover flange.

  NOTE: Do not remove the lockwashers and nuts.

  (c) Install nylon lifting straps to the lifting eyes of the cover. Use two hoists to remove the top cover from the container. Remove the hoists from the straps.

(3) Install the rear retainer detail of P60043 Shipping Container to the low pressure turbine (LPT).

  (a) Use a hoist to connect PWA 28657 Sling, and two PWA 76154 Adapters to the trunnion spools of the rear retainer (1202/8). Lift the retainer and put it to the rear of the LPT. See Figure 1202.

  (b) Retract the cap screws (1203/2)in the center hub (1203/3) of the retainer. See Figure 1203.

LOW PRESSURE TURBINE (LPT) − STORAGE−02

(c) Align the boltholes and put the retainer onto the turbine case. Use 38 cap screws, lock washers, and flat washers (1203/8) to attach the retainer to the rear outer flange of the turbine case. Tighten the screws.

(d) Align the boltholes and put the center hub detail (1203/3) into the turbine shaft. Install the hub to the shaft with eight cap screws (1202/4). Torque the screws to 7 lb−ft (9.5 N.m).

(e) Align the boltholes and attach the hub detail to the retainer with six cap screws and lock washers (1203/5). Do not tighten the screws.

(f) Tighten the six screws (1203/2) and jam nuts (1203/1) to retain the axial position of the turbine rotor.

(g) Tighten the previously installed screws (1203/5) that attach the center hub to the retainer.

(4) Remove Fixture (PWA 85583) from the low pressure turbine. See Figure 1204.

(a) Loosen jamnuts (1204/4) and nut (1204/8) as required to lower support plate (1204/6) from 6th stage LPT disk (1204/7).

(b) Remove bolts (1204/2) that attach the flange segment (1204/1) to turbine rear case (1204/3). Remove the fixture.

(5) Thread the adapter into the front end of the turbine shaft. Use the ball lock pin (1202/2) to attach the lifting arm to the adapter. See Figure 1202.

(6) Attach a second hoist to the lifting arm at the front end of the turbine shaft.

(7) Open the turbine shaft clamp details of the storage stand and the container. Use both hoists lift the turbine and lower it into the container. Align the turbine shaft with the turbine shaft clamp and the boltholes in the rear retainer with the boltholes in the container frame. Install the rear retainer to the container frame with eight cap screws (1203/7). Torque the screws to 50 lb−ft (67.8 N.m).

LOW PRESSURE TURBINE (LPT) − STORAGE−02

(8) Close the turbine shaft clamp (1202/12). Tighten the swing bolt nut.

(9) Remove the hoist and lifting arm at the front end of the turbine shaft. If necessary, rotate the clevis (detail−42) (1202/3) to remove the ball lock pin.

(10) Use the ball lock pin (1202/2) to install the bracket (1202/6) to the adapter at the front end of the turbine shaft. If necessary, rotate the clevis (1202/3) and bracket (1202/6) to align the two counterbored holes in the bracket with the two mating cap screws (1202/1) in the end of the "A" frame. Tighten the bolts to 425 lb−ft (576.2 N.m). Tighten the jamnuts (1202/5) to 425 lb−ft (576.2 N.m).

CAUTION: YOU MUST REPLACE THE FRONT RETAINER (PWA 85456 or PWA 85996) WITH THE FRONT RETAINER DETAIL OF THE CONTAINER WHICH HAS A PROTECTIVE COATING TO PREVENT CORROSION.

(11) Remove the retainer from the front flange of the turbine rear case and the front compressor drive turbine shaft.

(a) Remove two bolts that attach the upper and lower details of retainer.

(b) Remove four bolts and nuts that attach the upper and lower retainer details to low pressure turbine case.

(12) Install the front retainer detail of the container to the front flange of the turbine case and the turbine shaft. See Figure 1202.

(a) Align the center hole in front retainer (1202/10) with the dowel pin hole in the turbine case.

(b) Attach the retainer to the front flange of the turbine case at 6 and 12 o'clock locations with four bolts and nuts (1202/9).

(c) Attach the clamps of the retainer to the turbine shaft with two bolts (1202/11).

(13) Remove the hoist, sling, and adapters from the rear retainer assembly.

(14) Connect a hoist to the lifting rings on the top cover of the container, and position the top cover over the bottom half of the container. Align the dowel pins with the dowel pin holes and lower the top cover onto the bottom half of the container.

(15) Attach the container with the detail bolts and nuts.

(16) Install lockwire, MS20995−C41 through holes in cover flange and attach Lead Seal (P05−156). Use a bull dog pliers to compress seal on wire and cut off excess wire.

(17) Inspect the condition of Dehydrater (P15−001) and replace as required.

Task 72−53−00−540−002:

2. Unpack Low Pressure Turbine (LPT) With Shaft

A. Equipment And Materials Required

Special Tools:
PWA 25096 Stand, Storage (Optional To PWA 87330)
PWA 28657 Sling, Strongback, Handling
PWA 76154 Adapter (Two Required)
PWA 76270 Stand (Optional To PWA 87330)
PWA 85456 Retainer (Optional To PWA 85996)
PWA 85562 Sleeve, Support (Used With PWA 25096 Or PWA 76270)
PWA 85583 Retainer
PWA 85996 Retainer, Front
PWA 87330 Stand, Storage
PWA 87347 Sleeve, Support (Used With PWA 87330)

B. Procedure

(1) Break and remove the lockwire and seal from the container flange.

(2) Remove the top half of P60043 Container Assembly.

  (a) Open the manual pressure relief valve on the cover to relieve any pressure from the container.

  (b) Loosen the nuts on the "T" head bolts to permit the "T" heads to be rotated 90 degrees and pass through the slots in the cover flange.

  NOTE: Do not remove the lockwashers and nuts.

(c) Install nylon lifting straps to the lifting eyes of the cover. Use two hoists to remove the top cover from the container. Remove the hoists from the straps.

(3) Loosen the jam nuts (1202/5) and cap screws (1202/1) at the end of the "A" frame. Retract the screws from the bracket. Rotate the bracket and clevis (detail−42) (1202/3) as required to remove ball lock pin (1202/2) from the bracket (1202/6). See Figure 1202.

(4) Use the ball lock pin (1202/2) to attach the lifting arm (1202/7) to the clevis (1202/3). Attach a hoist to the lifting arm. Take up slack on the hoist.

(5) Remove the eight cap screws (1203/7) that attach the rear retainer to the frame of the container. See Figure 1203.

(6) Connect a hoist and PWA 28657 Sling with two PWA 76154 Adapters to the trunnion spools of the rear retainer.

(7) Loosen the nut and rotate the swing bolt to open the turbine shaft clamp (1202/12). See Figure 1202.

(8) Use both hoists to remove the turbine from the container.

(9) Install PWA 85562 Support Sleeve into the shaft support cradles of PWA 25096, PWA 76270 Stand or PWA 87347 Support Sleeve into the shaft support cradles of PWA 87330 Stand. Position details−1 and −2 forward and details−3 and −5 rearward with details−2 and −3 down. Tighten the set screws to attach the sleeve to the stand. See Figure 1205.

(10) Place the low pressure turbine in the storage stand. Tighten clamps around the turbine shaft and slide chocks inward to contact the rear flange of the turbine case.

NOTE: Chocks are utilized as a safety device and do not support any portion of assembly.

(11) Remove hoist from the front end of the turbine shaft. Remove the ball lock pin (1202/2) and lifting arm (1202/7) from the clevis (1202/3). Remove the adapter (1202/4) from the shaft. See Figure 1202.

(12) Remove the retainer (1206/3) from the front flange of the turbine rear case and the front compressor drive turbine shaft. See Figure 1206.

(a) Remove two bolts (1206/4) that attach the upper and lower details of retainer.

(b) Remove bolts (1206/2) and nuts (1206/1) that attach the upper and lower retainer details to low pressure turbine case.

(13) Install PWA 85456 or PWA 85996 Retainer to the front flange of the turbine case and the turbine shaft.

(a) Align the center hole in the front retainer (1206/3) with the dowel pin hole in the turbine case.

(b) Attach the retainer to the front flange of the turbine case at 6 and 12 o'clock locations with four bolts (1206/2) and nuts (1206/1).

(c) Attach the clamps of retainer to the front compressor drive turbine shaft with two bolts (1206/4).

(14) Install PWA 85583 Fixture to rear flange of turbine rear case.

(a) Center the flange segment (1204/1) to the rear flange of the turbine rear case (1204/3) at 12 o'clock location. Attach the flange segment to the case with six bolts (1204/2).

(b) Loosen two jamnuts (1204/8). Adjust nut (1204/4) to support the ID of 6th stage LPT disk (1204/7) to maintain the proper position of the low pressure turbine rotor. Tighten the jamnuts (1204/8).

(15) Remove the rear retainer (1202/6) from the turbine. See Figure 1203.

(a) Remove the six bolts (1203/5) that attach the hub (1203/3) to the rear retainer (1203/6).

(b) Remove the eight cap screws (1203/4) that attach the hub (1203/3) to the turbine shaft. Remove the hub.

LOW PRESSURE TURBINE (LPT) − STORAGE−02

(c) Remove the 38 bolts, lockwashers, and flat washers (1203/8) that attach the rear retainer to the turbine case.

(d) Remove the retainer, adapters, and sling.

(16) Lubricate the spline area at the front end of the turbine shaft with Engine Oil (P03−001). If the shaft is not coated in the area forward or rearward of the spline, lubricate these areas also.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Low Pressure Turbine (LPT)

List of Effective Pages - Low Pressure Turbine (LPT)

STAGE 3 TURBINE ROTOR ASSEMBLY - DISASSEMBLY-01

Task 72-53-03-040-001:

1. Disassemble 3rd Stage Turbine Rotor Assembly

A. Equipment And Materials Required

Special Tools:

PWA 85086 Arm (2 Required)
PWA 85214 Adapter, Lifting
PWA 85215 Adapter, Lifting
PWA 85226 Puller, Jackscrew
PWA 85385 Support, Rear

B. Procedure

(1) Place PWA 85385 Support on bench.

(2) Secure PWA 85214 Adapter to bore of 3rd stage LPT disk with lifting eye side up. Using hoist, position disk onto Fixture PWA 85385. Remove hoist and adapter.

(3) Unbend and remove 40 tierod locks (501/1) from turbine tierods (501/2). Discard tierod locks. Remove turbine tierods. Discard the tierods.

(4) Remove the 3rd stage airseal (501/3) from the disk (501/5) with PWA 85226 Jackscrew Puller.

  (a) Put the split rings below the airseal and connect the rings with the nuts provided.

  (b) Put the circular plate on the disk to engage the six (6) pick studs in the split rings.

  (c) Put the six (6) flanged nuts on the jack studs.

  (d) Tighten the nuts equally until the airseal is removed from the disk.

  (e) Put the airseal in a suitable container.

  (f) Remove the forty (40) washers (501/4) from the tierod holes.

(5) Trunnion rotor to front end down position.

  (a) Secure Adapter PWA 85214 to bore of disk with lifting eye side up. Connect hoist with PWA 85086 Arm to lifting eye of adapter.

(b) Using hoist, lift rotor assembly. Align boltholes and position PWA 85215 Adapter to lower (rear) side of disk with lifting eye side down. Install four cap screws through tierod holes in disk and into base of adapter and secure with hand knobs.

(c) Connect second hoist and PWA 85086 to lifting eye of Adapter PWA 85215. Using both hoists, lift and trunnion rotor to front end down position. Remove lower hoist, arm, and adapter. Lower disk onto suitable support and remove hoist, arm, and adapter.

CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

(6) Remove blades from disk blade slots.

(a) Using fiber drift or plastic mallet and working back and forth around disk, tap blade root platforms to remove blades from disk.

(b) Place blades into suitable, identified container.

(7) Reinstall Adapter PWA 85215 to rear face of disk per previous step. Connect hoist and Arm PWA 85086 to lifting eye of adapter. Using hoist, place disk on pallet. Remove hoist, arm and adapter.

Third Stage Turbine Rotor Assembly Disassembly
Figure 501
(Task 72−53−03−040−001)

Task 72−53−03−440−001:

1. Assemble 3rd Stage Turbine Rotor Assembly

A. Prerequisites

R (1) Refer to 72−53−00, Inspection/Check−04 (Task
R 72−53−00−990−001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 85086 Arm (Two Required)
PWA 85214 Adapter, Lifting
PWA 85215 Adapter, Lift And Trunnion
PWA 85385 Fixture, Support

C. Procedure

(1) Weigh all blades using a precision scale. Mark weight of each blade on the surface of the airfoil. Use temporary marking non−etching ink.

(2) Lay blades out on bench in order of decreasing weight.

(3) Number the blades from 1 to 128 in order of heaviest to lightest. Use temporary marking non−etching ink to mark blade number.

(4) Put the blades in the following sequence: 1, 128, 3, 126, 5, 124, ... 63, 66; 2, 127, 4, 125, 6, 123, ... 64, 65.

NOTE: This sequence alternates heavy blades next to light blades and balances blades of similar weights 180 degrees across the rotor. This method results in an equal distribution of heavy and light blades.

(5) Position PWA 85385 Support, smaller ID end down onto bench or rotary table.

(6) Position disk, rear face down, onto PWA 85385 Support.

(a) If disk is stored rear face down, attach PWA 85214 Adapter to bore of disk, with lifting eye side up. Using hoist, position disk onto Fixture PWA 85385. Remove hoist and adapter.

(b) If disk is stored front face down, attach Adapter PWA 85214, to bore of disk, with lifting eye side down. Attach PWA 85215 Adapter to upper face of disk, with lifting eye side up. Using hoists and two PWA 85086 Arms, lift and trunnion disk to rear end down position. Remove lower arm and adapter, and place disk on fixture PWA 85385.

(7) Install blade No. 1 into any disk blade slot. Install blade with trailing edge (longest side) down approximately half way into slot. Hold first blade by hand, exerting pressure in a counterclockwise direction and insert the next blade, in the order specified in the previous step, into the adjacent counterclockwise slot, approximately half way into slot. See Figure 1001 for a schematic view of the blade installation sequence.

(8) Continue installing blades this way until all blades are inserted into disk blade slots.

CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

(9) Using fiber drift or plastic mallet and working back and forth around disk, tap blade platforms, as necessary, to align blade shrouds.

CAUTION: DO NOT DAMAGE BLADE TANGS.

(10) Tap blades to seat blade tang against disk. Use fiber drift or plastic mallet.

D. Postrequisite Procedures

R (1) Static balance rotor assembly.Refer to 72-52-03,
R Assembly-02 (Task 72-52-03-440-002).

(Task 72−53−03−440−001)

STAGE 3 TURBINE ROTOR ASSEMBLY - ASSEMBLY-02

Task 72-53-03-440-002:

1. Balance Stage 3 Turbine Rotor Assembly (Disk And Blades)

A. Prerequisites

(1) Assemble stage 3 turbine rotor assembly by Assembly-01 (Task 72-53-03-440-001).

B. Equipment And Materials Necessary

Standard Tools:

Drift, Fiber
Hammer, Soft Face or Plastic

Special Tools:

PWA 25648	Screw Set, Holding (2 Necessary)
PWA 32492	Screw Set (2 Necessary)
PWA 80258	Plug Set, Locating
PWA 85190	Adapter, Locating (Optional To PWA 87086)
PWA 85192	Washer Set, Holding
PWA 85207	Weight, Calibration (Check Weight)
PWA 85214	Adapter, Lifting
PWA 85340	Plug Set, Holding
PWA 85385	Support
PWA 87086	Adapter, Balance
PWA 87213	Pin, Alignment (4 Necessary)
PWA 101395	Drift, Removal/Installation
PWA 103649	Air Cylinder, Balance
PWA 104240	Adapter, Balance (Optional To PWA 85190 Or PWA 87086)

Consumable Materials:

	Item No.	Designation
R	P05-323	Tape, Pressure Sensitive Sealing

C. Procedure

(1) Prepare the static balance locating adapter as follows:

(a) Use a hoist and sling and attach the PWA 85190 Locating Adapter or PWA 87086 Balance Adapter to the spindle of the balance machine with the four detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the four bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(b) Install PWA 80258 Locating Plugs in four locations on adapter marked 3LPT. Attach the plug set to the balance adapter with two PWA 32492 Screw Sets.

(c) Insert four PWA 85340 Hold Down Plugs in the four threaded holes on the balance adapter marked 3LPT. Tighten the holding plugs hand tight.

(d) Adjust the four locating plugs for a loose fit. Turn the four plugs to align the zero (0) (marked on the adjusting collar) with the scribed radial lines passing through the center of the balance adapter.

NOTE: Set zero (0) toward center of balance adapter.

(e) Thread four PWA 87213 Alignment Pins into the hold down plugs.

(2) Optional − Prepare the air cylinder and static balance adapter as follows:

(a) Use a hoist and sling and attach the PWA 103649 Balance Air Cylinder to the spindle of the balance machine with the six detail bolts.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(b) Use a hoist and sling and attach the PWA 104240 Balance Adapter to the air cylinder with the six detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(c) Turn the center bolt on the diaphragm fully clockwise (finger tight) to secure the diaphragm to the piston of the air cylinder.

1 If the balance machine is equipped with air controls, turn the air control to "unclamp". If the balance machine is not equipped with air controls, attach an air hose to the fitting on the OD of the air cylinder.

(3) Install the rotor assembly on the PWA 85190 or PWA 87086 balance adapter and adjust the locating plugs for proper fit. See Figure 1002.

(a) Put the PWA 85214 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(b) Attach a hoist to the lift eye of the adapter and lift the assembly. Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(c) Do not remove the hoist from the lift eye or the adapter from the assembly at this time.

(d) Adjust the locating plug set for a light interference fit with the outside diameter of the rotor assembly.

(e) Carefully remove the assembly from the balance adapter. Do not disturb the setting on the locating plug set.

(f) Set the locating plugs for the proper fit. The four locating plugs must be set to the same numerical marking after adjusting for proper fit.

(g) Tighten the four screws that attach the locating plugs to the balance adapter.

NOTE: Do not disturb the numeric position of the locating plugs while you tighten the screws.

R (h) Mark one hold down plug for reference. Use a
R marker given in Section 70-11-00 in the Standard
R Practices Manual, PN 585005.

(i) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

R R R (j) Mark the disk in line with referenced mark on hold down plug. Use a marker given in Section 70−11−00 in the Standard Practices Manual, PN 585005.

(k) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(l) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets. Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(4) Optional − Install the rotor assembly on the PWA 104240 Balance Adapter as follows:

(a) Lower the rotor assembly on the adapter and attach the rotor to the adapter with the two special shoulder screws. Tighten the screws.

(b) Turn the air control to "clamp", or remove the air hose from the OD of the cylinder to secure the rotor to the adapter.

(5) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(6) Turn the rotor assembly on the balance adapter 180 degrees from the original balance location as follows:

(a) Remove the screw sets and the washer set that attaches the rotor assembly to the adapter.

(b) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

(c) Put the PWA 85214 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(d) Attach the hoist to the lift eye and carefully lift the rotor off the adapter, turn it 180 degrees.

(e) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(f) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

(g) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets.

1 Matching screws must be used at diametrically opposite positions.

2 Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(7) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

STAGE 3 TURBINE ROTOR ASSEMBLY − ASSEMBLY−02

(8) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(b) If necessary, remove all ink markings of unbalance symbols (triangle) that were done before.

(9) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

NOTE: It is desirable to reduce residual unbalance to lowest value possible in practical amount of time.

(a) Use the PWA 85214 Lifting Adapter to remove the rotor assembly from the balance adapter. Put the assembly on the PWA 85385 Rear Support.

CAUTION: LIGHTLY HIT THE BLADE ROOT ONLY. YOU CAN EASILY DAMAGE THE AIRFOILS OR THE PLATFORMS OF THE BLADES IF THEY ARE HIT.

(b) Make a pyramid of the blades that must be removed. Lightly hit the blade root platforms with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to remove the blades.

CAUTION: BE VERY CAREFUL WHEN YOU SEAT THE BLADES OR DAMAGE TO THE BLADE TANGS CAN OCCUR.

(c) Lock the blade shrouds and engage the root of the blades into the disk. Lightly tap the blades with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to touch the blade tang against the disk.

(d) Put the assembly on the balance adapter.

(e) Static balance the rotor assembly as described above until the residual unbalance is not more than 1.0 oz−in. (720.0 g.mm).

(f) Record the heavy angle and the amount of assembly unbalance.

(g) Make a record of the last blade positions.

(10) Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

- (a) Install the PWA 85207 Calibration Weight (Check Weight) in one of the tiebolt holes on the front flange bolt circle as close as possible to the angle of residual unbalance.
- (b) Attach the check weight to the disk with Pressure Sensitive Sealing Tape P05−323.
- (c) The check weight pulls 2.0 oz−in. (1440.0 g.mm).
- (d) Do a check of the balance machine at 900 rpm minimum.
- (e) The amount of unbalance should pull 2.0 oz−in. (1440.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in. (288.0 g.mm).
- (f) Remove the check weight.

R (11) Mark the unbalance symbol (triangle), as shown on
R reference Figure 1002, at location of heavy unbalance.
R Use a marker given in Section 70−11−00 in the Standard
R Practices Manual, PN 585005.

(12) Using hoist and PWA 85214 Lifting Adapter remove rotor assembly from balance fixture.

R (13) Mark the unbalance symbol (triangle) on rear side of
R disk web. Use a marker given in Section 70−11−00 in
R the Standard Practices Manual, PN 585005.

(14) Place rotor assembly on PWA 85385 Support, rear face down. Remove adapter.

STAGE 3 TURBINE ROTOR ASSEMBLY - ASSEMBLY-03

Task 72-53-03-440-003:

1. Final Assemble 3rd Stage Turbine Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-53-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Balance 3rd stage turbine rotor assembly per Assembly-02 Task 72-53-03-440-002.

B. Equipment And Materials Required

Special Tools:

PWA 85214 Fixture, Lifting
PWA 85228 Bender, Manual

Consumable Materials:

Item No.	Designation
P05-102	Ice, Dry

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Tierod	40	72-53-00/3/550
Lock	40	72-53-00/3/560

C. Procedure

(1) Install 40 turbine tierods (1001/2) through airseal (1001/3). See Figure 1001.

NOTE: Do not reuse tierods; Use new tierods.

(2) Install 40 tierod locks (1001/1) to secure turbine tierod (1001/2) to 3rd stage airseal (1001/3). Bend tierod locks using PWA 85228 Bender. Inspect tierod locks per requirements of Figure 1002.

(3) Use Dry Ice P05-102 to chill the air seal and tierod assembly.

(4) Install PWA 85214 Lifting Fixture onto 3rd stage turbine rotor.

(5) Remove assembly from dry ice and position 40 washers (1001/4), equally spaced, on tierods in 3rd stage airseal.

(6) Locate triangular unbalance marks on airseal (1001/3) and disk (1001/5). With unbalance mark on airseal 180 degrees from unbalance mark on disk, align boltholes and seat disk on airseal.

WARNING: ENSURE THAT AIRSEAL IS TIGHT ON DISK BEFORE LIFTING, TO PREVENT IT'S BECOMING UNSEATED OR DROPPING FROM DISK.

(7) Using hoist, position rotor assembly, airseal down, on suitable support. Remove lift fixture.

STAGE 4 TURBINE ROTOR ASSEMBLY - DISASSEMBLY-01

Task 72-53-04-040-001:

1. Disassemble 4th Stage Turbine Rotor Assembly

A. Equipment And Materials Required

Special Tools:

PWA 85086 Arm, Lifting (Two Required)
PWA 85215 Adapter, Lifting
PWA 85227 Puller, Jackscrew
PWA 85392 Support
PWA 85594 Adapter, Lift And Trunnion

B. Procedure
See Figure 501.

(1) Using PWA 85215 Lift Adapter position rotor onto bench or rotary table.

(2) Unbend tierod locks (501/3) securing 40 turbine tierods (501/2) to rear ID flange of 4th stage LPT disk (501/4). Discard locks. Remove turbine tierods. Discard the turbine tierods.

(3) Trunnion rotor to rear end down position on PWA 85392 Support on bench or rotary table.

(a) Attach PWA 85215 Lifting Adapter to rear (upper) flange of disk with lifting eye side up. Connect hoist with PWA 85086 Arm to lifting eye of adapter.

(b) Using hoist, lift rotor assembly and secure PWA 85594 Adapter to front (lower) flange of disk with lifting eye side down.

(c) Connect second hoist with PWA 85086 Arm to lifting eye of lower adapter. Using both hoists, lift and trunnion rotor assembly to rear end down position. Remove lower hoist, arm and adapter. Lower disk onto PWA 85392 Support. Remove hoist and arm.

(4) Remove 4th stage LPT airseal (501/1) using PWA 85227 Puller.

(a) Loosen flange nut and open split halves of puller plates.

(b) Place plate halves, with stud side up, around and under base of lower knife−edge seal. Secure plate halves with swing bolt and flange nut.

(c) Align boltholes in upper plate with studs in lower plate and seat upper plate on upper flange of disk. Install washers and jamnuts to studs.

(d) Using suitable tightening sequence, to prevent distortion of airseal, tighten jamnuts to remove airseal.

(e) Remove puller from airseal. Place airseal in suitable container.

(5) Trunnion rotor assembly to front end down position on support.

(a) Secure Adapter PWA 85215 to rear (upper) flange of disk with lifting eye side up. Connect hoist with Arm PWA 85086 to lifting eye of adapter.

(b) Using hoist, lift rotor assembly. Secure Adapter PWA 85594 to front (lower) flange of disk with lifting eye side down.

(c) Connect second hoist with Arm PWA 85086 to lifting eye of lower adapter. Using both hoists, lift and trunnion rotor assembly to front end down position. Remove lower hoist, arm and adapter. Lower disk onto support PWA 85392. Remove hoist and arm.

CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

(6) Remove blades from disk blade slots.

(a) Using fiber drift or plastic mallet and working back and forth around disk, tap blade root platforms to remove blades from disk.

(b) Place blades into suitable, identified container.

(7) Reconnect hoist and place disk on pallet. Remove hoist and adapter.

Figure 501
(Task 72−53−04−040−001)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-53-04-440-001:

1. Assemble 4th Stage Turbine Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-53-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 85086 Arm, Lifting (Two Required)
PWA 85215 Adapter, Lifting
PWA 85392 Support
PWA 85594 Adapter, Lift And Trunnion

C. Procedure
See Figure 1001.

(1) Weigh all blades using a precision scale. Mark weight of each blade on the surface of the airfoil. Use temporary marking non-etching ink. R

(2) Lay blades out on bench in order of decreasing weight.

(3) Number the blades from 1 to 130 in order of heaviest to lightest. Use temporary marking non-etching ink to mark blade number.

(4) Put the blades in the following sequence: 1, 130, 3, 128, 5, 126, ... 63, 68, 65; 2, 129, 4, 127, 6, 125, ... 64, 67, 66.

NOTE: This sequence alternates heavy blades next to light blades and balances blades of similar weights 180 degrees across the rotor. This method results in an equal distribution of heavy and light blades.

(5) Position disk, rear flange down, onto PWA 85392 Support on bench or rotary table.

(a) If disk is stored rear flange down, attach PWA 85594 Adapter to front (upper) flange of disk with lifting eye side up. Using hoist, position disk onto PWA 85392 Support. Remove hoist and adapter.

(b) If disk is stored rear flange up, attach PWA 85215 Adapter to rear (upper) flange of disk with lifting eye side up. Attach hoist with PWA 85086 Arm to lifting eye of adapter. Secure Adapter PWA 85594 to front (lower) flange of disk with lifting eye side down. Connect second hoist with PWA 85086 Arm, to lifting eye of adapter. Using hoists lift and trunnion disk to rear flange down position. Remove lower hoist, arm and adapter and place disk onto PWA 85392 Support. Remove hoist, arm and adapter.

(6) Install blade No. 1 into any disk blade slot. Install blade with trailing edge (longest side) down approximately half way into slot. Hold first blade by hand, exerting pressure in a counterclockwise direction and insert the next blade, in the order specified in the previous step, into the adjacent counterclockwise slot, approximately half way into slot. See Figure 1002 for a schematic view of the blade installation sequence.

(7) Continue installing blades this way until all blades are inserted into disk blade slots.

CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

(8) Using fiber drift or plastic mallet and working back and forth around disk, tap blade platforms, as necessary, to align blade shrouds.

CAUTION: DO NOT DAMAGE BLADE TANGS.

(9) Tap blades to seat blade tang against disk. Use fiber drift or plastic mallet.

D. Postrequisite Procedures

(1) Static balance rotor assembly per Assembly−02 (Task 72−53−04−440−002).

STAGE 4 TURBINE ROTOR ASSEMBLY - ASSEMBLY-02

Task 72-53-04-440-002:

1. Balance Stage 4 Turbine Rotor Assembly

A. Prerequisites

(1) Assemble stage 4 turbine rotor assembly by Assembly-01 (Task 72-53-04-440-001).

B. Equipment And Materials Necessary

Standard Tools:

Drift, Fiber
Hammer, Soft Face or Plastic

Special Tools:

PWA 25648	Screw Set, Holding (2 Necessary)
PWA 32492	Screw Set (2 Necessary)
PWA 80258	Plug Set, Locating
PWA 85190	Adapter, Locating (Optional To PWA 87086)
PWA 85191	Plug Set, Holding
PWA 85192	Washer Set, Holding
PWA 85207	Weight, Calibration (Check Weight)
PWA 85594	Adapter, Lifting
PWA 87086	Adapter, Balance
PWA 87213	Pin, Alignment (4 Necessary)
PWA 101395	Drift, Removal/Installation
PWA 103649	Air Cylinder, Balance
PWA 104241	Adapter, Balance (Optional To PWA 85190 Or PWA 87086)

Consumable Materials:

Item No.	Designation
P05-026	Ink (PMC 4057-1)
P05-045	Marker (PMC 4092-1 or PMC 4092-2)
P05-323	Tape, Pressure Sensitive Sealing

C. Procedure

(1) Prepare the static balance locating adapter as follows:

(a) Use a hoist and sling and attach the PWA 85190 Locating Adapter or the PWA 87086 Balance Adapter to the spindle of the balance machine with the four detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the four bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

R (b) Install the PWA 85191 Holding Plug Set in the four threaded holes on the balance adapter marked 4LPT. Tighten the holding plugs hand tight.

(c) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(d) Install the PWA 80258 Locating Plugs in the four locations on the adapter marked 4LPT. Attach the plug set to the balance adapter with the two PWA 32492 Screw Sets.

(e) Adjust the four locating plugs for a loose fit. Turn the four plugs to align the zero (0) (marked on the adjusting collar) with the scribed radial lines passing through the center of the balance adapter.

NOTE: Set zero (0) toward the center of the balance adapter.

(2) Optional − Prepare the air cylinder and static balance adapter as follows:

(a) Use a hoist and sling and attach the PWA 103649 Balance Air Cylinder to the spindle of the balance machine with the six detail bolts.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(b) Use a hoist and sling and attach the PWA 104241 Balance Adapter to the air cylinder with the six detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(c) Turn the center bolt on the diaphragm fully clockwise (finger tight) to secure the diaphragm to the piston of the air cylinder.

(d) Install the detail slide clamps (marked LPT−4) onto the shoulder bolts and move the clamps inward toward the machine spindle.

(e) Turn the center cap screw on the air cylinder valve one full turn counter−clockwise.

(f) Turn the valve housing to ID and turn the center cap screw clockwise to tighten.

1 If the balance machine is equipped with air controls, turn the air control to "unclamp". If the balance machine is not equipped with air controls, attach an air hose to the fitting on the OD of the air cylinder.

(3) Install the rotor assembly on the PWA 85190 or PWA 87086 balance adapter and adjust the locating plugs for proper fit. See Figure 1002.

(a) Put the PWA 85214 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(b) Attach a hoist to the lift eye of the adapter and lift the assembly. Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(c) Do not remove the hoist from the lift eye or the adapter from the assembly at this time.

(d) Adjust the locating plug set for a light interference fit with the outside diameter of the rotor assembly.

(e) Carefully remove the assembly from the balance adapter. Do not disturb the setting on the locating plug set.

(f) Set the locating plugs for the proper fit. The four locating plugs must be set to the same numerical marking after adjusting for proper fit.

(g) Tighten the four screws that attach the locating plugs to the balance adapter.

NOTE: Do not disturb the numeric position of the locating plugs while you tighten the screws.

(h) Mark one hold down plug for reference with a Marker P05−045.

(i) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(j) Mark the disk in line with referenced mark on hold down plug with a Marker P05−045.

(k) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(l) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets. Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(4) Optional − Install the rotor assembly on the PWA 104241 Balance Adapter as follows:

(a) Lower the rotor assembly on the adapter, make sure to engage the two locating pins into the bolt circle of the disk.

(b) Reach through the bore of the disk and move the slide clamps radially outward.

(c) Turn the air control to "clamp", or remove the air hose from the OD of the cylinder to secure the rotor to the adapter.

(5) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(6) Turn the rotor assembly on the balance adapter 180 degrees from the original balance location as follows:

(a) Remove the screw sets and the washer set that attaches the rotor assembly to the adapter.

(b) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

(c) Put the PWA 85214 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(d) Attach the hoist to the lift eye and carefully lift the rotor off the adapter, turn it 180 degrees.

(e) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(f) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

(g) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets.

1 Matching screws must be used at diametrically opposite positions.

2 Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(7) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(8) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(b) If necessary, remove all ink markings of unbalance symbols (triangle) that were done before.

(9) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

NOTE: It is desirable to reduce residual unbalance to lowest value possible in practical amount of time.

(a) Use the PWA 85214 Lifting Adapter to remove the rotor assembly from the balance adapter. Put the assembly on the PWA 85385 Rear Support.

CAUTION: LIGHTLY HIT THE BLADE ROOT ONLY. YOU CAN EASILY DAMAGE THE AIRFOILS OR THE PLATFORMS OF THE BLADES IF THEY ARE HIT.

(b) Make a pyramid of the blades that must be removed. Lightly hit the blade root platforms with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to remove the blades.

CAUTION: BE VERY CAREFUL WHEN YOU SEAT THE BLADES OR DAMAGE TO THE BLADE TANGS CAN OCCUR.

(c) Lock the blade shrouds and engage the root of the blades into the disk. Lightly tap the blades with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to touch the blade tang against the disk.

(d) Put the assembly on the balance adapter.

(e) Static balance the rotor assembly as described above until the residual unbalance is not more than 1.0 oz−in. (720.0 g.mm).

(f) Record the heavy angle and the amount of assembly unbalance.

(g) Make a record of the last blade positions.

(10) Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

(a) Install the PWA 85207 Calibration Weight (Check Weight) in one of the tiebolt holes on the front flange bolt circle as close as possible to the angle of residual unbalance.

(b) Attach the check weight to the disk with Pressure Sensitive Sealing Tape P05−323.

(c) The check weight pulls 2.0 oz−in. (1440.0 g.mm).

(d) Do a check of the balance machine at 900 rpm minimum.

(e) The amount of unbalance should pull 2.0 oz−in. (1440.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in. (288.0 g.mm).

(f) Remove the check weight.

(11) Ink mark unbalance symbol (triangle) using Ink P05−026, as shown on reference Figure 1002, at heavy unbalance.

(12) Using hoist and PWA 85594 Adapter, remove rotor assembly from balance fixture.

(13) Store rotor assembly, rear flange down. Remove adapter.

D. Postrequisites

(1) Final assemble stage 4 turbine rotor assembly by Assembly−03 (Task 72−53−04−440−003).

(Task 72-53-04-440-002)

Task 72-53-04-440-003:

1. Final Assemble 4th Stage Turbine Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-53-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Balance 4th stage turbine rotor assembly per Assembly-02 (Task 72-53-04-440-002).

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 29754	Control, Heater
PWA 85086	Arm, Lifting (2 Required)
PWA 85215	Adapter, Lift And Trunnion
PWA 85229	Bender, Manual (Optional To PWA 103631)
PWA 85320	Heater, Electrical
PWA 85594	Adapter, Lift And Trunnion
PWA 103631	Bender, Manual (Optional To PWA 85229)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Tierod, Turbine	40	72-53-00/4/90
Lock, Turbine Tierod	40	72-53-00/4/100

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure
See Figure 1001.

(1) Optional, position PWA 85320 Heater on 4th stage disk.

NOTE: You can use the optional flameless torch or flame torch as previously specified to heat the disk.

(a) Remove ball lock pins and raise four support pins to upper positions. Secure support pins with ball lock pins.

(b) Using handles, carefully lift and centralize heater on front face of disk. Ensure that heater seats properly on face of disk.

(c) Connect PWA 29754Heater Control to junction box of heater.

(d) Connect thermocouple connector to heater control.

CAUTION: TEMPERATURE OF DISK MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO PART MAY OCCUR.

(2) Use the PWA 85320 Heater, or the optional flameless torch or flame torch, to heat the disk. Heat the disk to obtain a minimum temperature difference of 250°F (138.8°C) between mating parts. If applicable, remove the heater.

STAGE 4 TURBINE ROTOR ASSEMBLY - ASSEMBLY-03

(3) Chill 4th stage airseal (1001/3).

CAUTION: BLADES THAT HAVE BLENDED BLADE ROOT TANGS CAN NOT BE INSTALLED AGAINST THE AIRSEAL ANTIROTATION LUGS (REFERENCE 72-53-08, REPAIR-10, TASK 72-53-08-300-010).

(4) Locate unbalance marks on airseal and disk. Place unbalance mark on airseal 180 degrees clockwise from unbalance mark on disk.

WARNING: ENSURE THAT AIRSEAL IS TIGHT ON DISK BEFORE TRUNNIONING, TO PREVENT IT'S BECOMING UNSEATED OR DROPPING FROM DISK.

(5) Attach PWA 85594 Adapter to front (upper) flange of disk, with lifting eye side up. Attach hoist with PWA 85086 Arm to lifting eye of adapter. Secure PWA 85215 Adapter to rear (lower) flange of disk with lifting eye side down. Connect second hoist with PWA 85086 Arm to lifting eye of adapter. Using hoists, lift and trunnion disk to front end down position. Remove lower hoist, arm and adapter, and place rotor onto bench. Remove upper hoist, arm and adapter.

(6) Install 40 turbine tierods into rear ID flange of 4th stage LPT disk.

NOTE: Do not reuse tierods; Use new tierods.

(a) With flat side of bolthead facing outward, insert tierods, boltheads down, through 40 equally spaced boltholes in rear flange of disk.

(b) Install 40 tierod locks into grooves between tierods and rear ID flange of disk. Bend the tierod locks with the use of PWA 85229 Manual Bender or PWA 103631 Manual Bender.

(c) Inspect tierod locks per dimension specified in Figure 1002.

STAGE 5 TURBINE ROTOR ASSEMBLY - DISASSEMBLY-01

Task 72-53-05-040-001:

1. Disassemble 5th Stage Turbine Rotor Assembly
   A. Equipment And Materials Required

      Special Tools:
      PWA 85086 Arm (Two Required)
      PWA 85566 Puller, Knocker
      PWA 85592 Eye, Lifting
      PWA 85594 Adapter, Lift And Trunnion

   B. Procedure
      (1) Install PWA 85592 Eye Lifting to turbine rear hub.
      (2) Using hoist, position assembly onto suitable support. Remove hoist and lifting adapter.
      (3) Remove 5th stage airseal using PWA 85566 Puller.
         (a) With hand knob outward, position puller jaws over rim of airseal and seat on upper face of airseal.
         (b) Tighten hand knob to secure puller in place.
         (c) Using sliding hammer and relocating puller around airseal as required, remove airseal from hub.
         (d) Remove puller from airseal.
      (4) Install PWA 85594 Trunnion Adapter to turbine hub.
      (5) Using hoist and two PWA 85086 Arms, trunnion assembly to front end down position and lower onto suitable support.

      CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

      (6) Remove blades from hub blade slots.
         (a) Using fiber drift or plastic mallet and working back and forth around hub, tap blade root platforms to remove blades from hub.
         (b) Place blades into suitable, identified container.
      (7) Reconnect hoist to trunnion adapter. Trunnion hub to rear end down position and place hub on pallet. Remove hoist and adapter.

STAGE 5 TURBINE ROTOR ASSEMBLY - ASSEMBLY-01

Task 72-53-05-440-001:

1. Assemble 5th Stage Turbine Rotor Assembly

A. Prerequisites

(1) See 72-53-00, Inspection/Check-04 (Task 72-53-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 85592 Eye, Lifting

C. Procedure

R (1) Weigh all blades using a precision scale. Mark weight of each blade on the surface of the airfoil. Use temporary marking non-etching ink.

(2) Lay blades out on bench in order of decreasing weight.

(3) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72-256) Number the blades from 1 to 118 in order of heaviest to lightest. Use temporary marking non-etching ink to mark blade number.

(4) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72-256) Number the blades from 1 to 126 in order of heaviest to lightest. Use temporary marking non-etching ink to mark blade number.

(5) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72-256) Put the blades in the following sequence: 1, 118, 3, 116, 5, 114, ... 57, 62, 59; 2, 117, 4, 115, 6, 113, ... 58, 61, 60.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
This sequence alternates heavy blades next to light blades and balances blades of similar weights 180 degrees across the rotor. This method results in an equal distribution of heavy and light blades.

(6) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72−256) Put the blades in the following sequence: 1, 126, 3, 124, 5, 122, ... 61, 66, 63; 2, 125, 4, 123, 6, 121, ... 62, 65, 64.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
This sequence alternates heavy blades next to light blades and balances blades of similar weights 180 degrees across the rotor. This method results in an equal distribution of heavy and light blades.

(7) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Number the blades from 1 to 126 in order of heaviest to lightest. Use temporary marking non−etching ink to mark blade number.

(8) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the blades in the following sequence: 1, 126, 3, 124, 5, 122, ... 61, 66, 63; 2, 125, 4, 123, 6, 121, ... 62, 65, 64.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
This sequence alternates heavy blades next to light blades and balances blades of similar weights 180 degrees across the rotor. This method results in an equal distribution of heavy and light blades.

(9) Position hub, rear face down, onto suitable support on bench or rotary table. Using PWA 85592 Lifting Eye.

(10) Install blade No. 1 into any hub blade slot. Install blade with trailing edge (longest side) down approximately half way into slot. Hold first blade by hand, exerting pressure in a counterclockwise direction and insert the next blade, in the order specified in the previous step, into the adjacent counterclockwise slot, approximately half way into slot. See Figure 1001 or Figure 1002 as applicable for a schematic view of the blade installation sequence.

(11) Continue installing blades this way until all blades are inserted into hub blade slots.

R
R

CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

(12) Using fiber drift or plastic mallet and working back and forth around hub, tap blade platforms, as necessary, to align blade shrouds.

CAUTION: DO NOT DAMAGE BLADE TANGS.

(13) Tap blades to seat blade tang against hub. Use fiber drift or plastic mallet.

D. Postrequisite Procedures

(1) Static balance the 5th stage turbine rotor assembly by 72-53-05, Assembly-02 Task 72-53-05-440-002.

Figure 1002
(Task 72−53−05−440−001)

STAGE 5 TURBINE ROTOR ASSEMBLY - ASSEMBLY-02

Task 72-53-05-440-002:

1. Balance Stage 5 Turbine Rotor Assembly

A. Prerequisites

(1) Assemble stage 5 turbine rotor assembly by Assembly-01 (Task 72-53-05-440-001).

B. Equipment And Materials Necessary

Standard Tools:

Drift, Fiber
Hammer, Soft Face or Plastic

Special Tools:

PWA 25648	Screw Set, Holding (2 Necessary)
PWA 32492	Screw Set (2 Necessary)
PWA 80258	Plug Set, Locating
PWA 85190	Adapter, Locating (Optional To PWA 87086)
PWA 85192	Washer Set, Holding
PWA 85208	Weight, Calibration (Check Weight)
PWA 85340	Plug Set, Holding
PWA 85592	Adapter, Lifting
PWA 87086	Adapter, Balance
PWA 87213	Pin, Alignment (4 Necessary)
PWA 101395	Drift, Removal/Installation
PWA 103649	Air Cylinder, Balance
PWA 104240	Adapter, Balance (Optional To PWA 85190 Or PWA 87086)

Consumable Materials:

Item No.	Designation
P05-026	Ink (PMC 4057-1)
P05-045	Marker (PMC 4092-1 or PMC 4092-2)
P05-323	Tape, Pressure Sensitive Sealing

C. Procedure

(1) Prepare the static balance locating adapter as follows:

(a) Use a hoist and sling and attach the PWA 85190 Locating Adapter or the PWA 87086 Balance Adapter to the spindle of the balance machine with the four detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the four bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(b) Install the PWA 85340 Holding Plug Set in the four threaded holes on the balance adapter marked 5LPT. Tighten the holding plugs hand tight.

(c) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(d) Install the PWA 80258 Locating Plugs in the four locations on the adapter marked 5LPT. Attach the plug set to the balance adapter with the two PWA 32492 Screw Sets.

(e) Adjust the four locating plugs for a loose fit. Turn the four plugs to align the zero (0) (marked on the adjusting collar) with the scribed radial lines passing through the center of the balance adapter.

NOTE: Set zero (0) toward the center of the balance adapter.

(2) Optional − Prepare the air cylinder and static balance adapter as follows:

(a) Use a hoist and sling and attach the PWA 103649 Balance Air Cylinder to the spindle of the balance machine with the six detail bolts.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(b) Use a hoist and sling and attach the PWA 104240 Balance Adapter to the air cylinder with the six detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(c) Turn the center bolt on the diaphragm fully clockwise (finger tight) to secure the diaphragm to the piston of the air cylinder.

1 If the balance machine is equipped with air controls, turn the air control to "unclamp". If the balance machine is not equipped with air controls, attach an air hose to the fitting on the OD of the air cylinder.

(3) Install the rotor assembly on the PWA 85190 or PWA 87086 balance adapter and adjust the locating plugs for proper fit. See Figure 1002.

(a) Put the PWA 85592 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(b) Attach a hoist to the lift eye of the adapter and lift the assembly. Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(c) Do not remove the hoist from the lift eye or the adapter from the assembly at this time.

(d) Adjust the locating plug set for a light interference fit with the outside diameter of the rotor assembly.

(e) Carefully remove the assembly from the balance adapter. Do not disturb the setting on the locating plug set.

(f) Set the locating plugs for the proper fit. The four locating plugs must be set to the same numerical marking after adjusting for proper fit.

(g) Tighten the four screws that attach the locating plugs to the balance adapter.

NOTE: Do not disturb the numeric position of the locating plugs while you tighten the screws.

(h) Mark one hold down plug for reference with a Marker P05−045.

(i) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(j) Mark the disk in line with referenced mark on hold down plug with a Marker P05−045.

(k) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(l) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets. Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(4) Optional − Install the rotor assembly on the PWA 104240 Balance Adapter as follows:

(a) Lower the rotor assembly on the adapter and attach the rotor to the adapter with the two special shoulder screws.

(b) Turn the air control to "clamp", or remove the air hose from the OD of the cylinder to secure the rotor to the adapter.

(5) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(6) Turn the rotor assembly on the balance adapter 180 degrees from the original balance location as follows:

(a) Remove the screw sets and the washer set that attaches the rotor assembly to the adapter.

STAGE 5 TURBINE ROTOR ASSEMBLY − ASSEMBLY−02

(b) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

(c) Put the PWA 85592 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(d) Attach the hoist to the lift eye and carefully lift the rotor off the adapter, turn it 180 degrees.

(e) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(f) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

(g) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets.

1 Matching screws must be used at diametrically opposite positions.

2 Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(7) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

STAGE 5 TURBINE ROTOR ASSEMBLY − ASSEMBLY−02

(8) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(b) If necessary, remove all ink markings of unbalance symbols (triangle) that were done before.

(9) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

NOTE: It is desirable to reduce residual unbalance to lowest value possible in practical amount of time.

(a) Use the PWA 85592 Lifting Adapter to remove the rotor assembly from the balance adapter.

CAUTION: LIGHTLY HIT THE BLADE ROOT ONLY. YOU CAN EASILY DAMAGE THE AIRFOILS OR THE PLATFORMS OF THE BLADES IF THEY ARE HIT.

(b) Make a pyramid of the blades that must be removed. Lightly hit the blade root platforms with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to remove the blades.

CAUTION: BE VERY CAREFUL WHEN YOU SEAT THE BLADES OR DAMAGE TO THE BLADE TANGS CAN OCCUR.

(c) Lock the blade shrouds and engage the root of the blades into the disk. Lightly tap the blades with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to touch the blade tang against the disk.

(d) Put the assembly on the balance adapter.

(e) Static balance the rotor assembly as described above until the residual unbalance is not more than 1.0 oz−in. (720.0 g.mm).

(f) Record the heavy angle and the amount of assembly unbalance.

(g) Make a record of the last blade positions.

STAGE 5 TURBINE ROTOR ASSEMBLY − ASSEMBLY−02

(10) Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

  (a) Install the PWA 85208 Calibration Weight (Check Weight) in one of the tiebolt holes on the front flange bolt circle as close as possible to the angle of residual unbalance.

  (b) Attach the check weight to the disk with Pressure Sensitive Sealing Tape P05−323.

  (c) The check weight pulls 2.0 oz−in. (1440.0 g.mm).

  (d) Do a check of the balance machine at 900 rpm minimum.

  (e) The amount of unbalance should pull 2.0 oz−in. (1440.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in. (288.0 g.mm).

  (f) Remove the check weight.

(11) Ink mark unbalance symbol (triangle) using Ink P05−026, as shown on reference Figure 1002, at heavy unbalance.

(12) Using hoist and PWA 85592 Adapter, remove rotor assembly from balance fixture.

(13) Store rotor assembly, rear flange down. Remove adapter.

D. Postrequisites

(1) Final assemble stage 5 turbine rotor assembly by Assembly−03 (Task 72−53−05−440−003).

STAGE 5 TURBINE ROTOR ASSEMBLY - ASSEMBLY-03

Task 72-53-05-440-003:

1. Final Assemble 5th Stage Turbine Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-53-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Balance 5th stage turbine rotor assembly per Assembly-02 Task 72-53-05-440-002.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 29754	Control, Heater
PWA 85320	Heater, Electrical
PWA 85592	Adapter, Lifting

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure
See Figure 1001.

(1) Optional, position PWA 85320 Heater on turbine rear hub.

NOTE: You can use the optional flameless torch or flame torch as previously specified to heat the disk.

(a) Remove ball lock pins and raise four support pins to lower positions. Secure support pins with ball lock pins.

(b) Using handles, carefully lift and centralize heater on front face of hub. Ensure that heater seats properly on face of hub.

(c) Connect PWA 29754 Heater Control to junction box of heater.

(d) Connect thermocouple connector to heater control.

CAUTION: TEMPERATURE OF DISK MUST NOT EXCEED 400°F (204.4°C) OR DAMAGE TO PARTS MAY OCCUR.

(2) Use the PWA 85320 Heater, or the optional flameless torch or flame torch, to heat the disk. Heat the disk to obtain a minimum temperature difference of 250°F (138.8°C) between mating parts. If applicable, remove the heater.

(3) Chill 5th stage LPT airseal.

STAGE 5 TURBINE ROTOR ASSEMBLY − ASSEMBLY−03

CAUTION: BLADES THAT HAVE BLENDED BLADE ROOT TANGS CAN NOT BE INSTALLED AGAINST THE AIRSEAL ANTI−ROTATION LUGS (REFERENCE 72−53−09, REPAIR−10, TASK 72−53−09−300−010).

(4) Locate triangular unbalance marks on airseal (1001/1) and hub (1001/2). Install airseal onto disk with unbalance mark on airseal 180 degrees from unbalance mark on hub and mating tabs on airseal between lugs of blades.

(5) Using hoist and PWA 85592 Lifting Adapter, store rotor assembly on suitable support. Remove hoist and lifting adapter.

STAGE 6 TURBINE ROTOR ASSEMBLY - DISASSEMBLY-01

Task 72-53-06-040-001:

1. Disassemble 6th Stage Turbine Rotor Assembly

A. Equipment And Materials Required

Special Tools:

PWA 85086 Arm, Lifting (Two Required)
PWA 85592 Eye, Lifting
PWA 85594 Adapter, Lift And Trunnion
PWA 86354 Extractor, Lock

B. Procedure

(1) Install PWA 85592 Lifting Eye onto 6th stage LPT disk.

(a) Loosen hand knobs and retract clamp details.

(b) Position base detail through ID of disk bore.

(c) Position clamp details to seat against ID and rear face of disk.

(d) Tighten hand knobs to secure adapter to disk.

(2) Connect hoist to lifting eye and position rotor assembly front, knife-edge, end down on workbench. Remove hoist.

R R (3) Use PWA 86354 Extractor to unbend and remove 128 turbine blade locks.

(a) Install the starting jaws into the extractor. Bend the locks to an open position.

NOTE: The starting jaw has an 20 degree angled jaw face.

(b) Remove the starting jaws and install the finishing jaw. Bend the locks straight for removal. Discard the locks.

NOTE: The finishing jaw has a flat jaw face.

(4) Install PWA 85594 Lift And Trunnion Adapter to disk. Install two PWA 85086 Lifting Arms.

STAGE 6 TURBINE ROTOR ASSEMBLY − DISASSEMBLY−01

(5) Using hoist, lift and trunnion rotor assembly to rear end down position. Lower assembly onto suitable support to allow removal of blades.

CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

(6) Remove blades from disk blade slots.

(a) Using fiber drift or plastic mallet and working back and forth around disk, tap blade root platforms to remove blades from disk.

(b) Place blades into suitable, identified container.

(7) Reconnect hoist to trunnion adapter and place disk on pallet. Remove lift tooling. Place suitable protector around knife−edge airseals.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-53-06-440-001:

1. Assemble 6th Stage Turbine Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-53-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 85386 Support, Front
PWA 85592 Eye, Lifting

C. Procedure

(1) Weigh all blades using precision scale. Mark weight
R of each blade on the surface of the airfoil. Use temporary marking non-etching ink.

(2) Lay blades out on bench in order of decreasing weight.

(3) Number the blades from 1 to 128 in order of heaviest to lightest. Use temporary marking non-etching ink to mark blade number.

(4) Put the blades in the following order: 1, 128, 3, 126, 5, 124, ... 63, 66; 2, 127, 4, 125, 6, 123, ... 64, 65.

NOTE: This sequence alternates heavy blades next to light blades and balances blades of similar weights 180 degrees across the rotor. This method results in an equal distribution of heavy and light blades.

CAUTION: MAKE SURE THAT EIGHT 6TH STAGE LPT SEALS ARE INSTALLED ON THE FRONT FLANGE OF THE 6TH STAGE LPT DISK. OPERATION OF THE ENGINE WITHOUT THE SEALS INSTALLED WILL CAUSE VERY HIGH TEMPERATURES WHICH CAN DECREASE THE DISK LIFE.

(5) Position disk with flange down, using PWA 85592 Lifting Eye and hoist onto PWA 85386 Front Support. Support Ring places on bench or rotary table.

(6) Install blade No. 1 into any disk blade slot. Install blade with trailing edge (longest side) up approximately half way into slot. Hold first blade by hand, exerting pressure in counterclockwise direction and insert the next blade, in the order specified in the previous step, into the adjacent counterclockwise slot, approximately half way into slot. See Figure 1001 for a schematic view of the blades installation sequence.

(7) Continue installing blades this way until all blades are inserted into disk blade slots.

CAUTION: TAP ONLY ON ROOT PLATFORM. AIRFOIL SECTIONS ARE EASILY DAMAGED.

(8) Using fiber drift or plastic mallet and working back and forth around disk, tap blade platforms, as necessary, to align blade shrouds.

(9) Tap blades into blade slots until blade lock radius in lug at rear of blade platform aligns with mating blade lock radius in disk. Use fiber drift or plastic mallet.

D. Postrequisites

(1) Static balance 6th stage rotor assembly per Assembly−02 Task 72−53−06−440−002.

STAGE 6 TURBINE ROTOR ASSEMBLY - ASSEMBLY-02

Task 72-53-06-440-002:

1. Balance Stage 6 Turbine Rotor Assembly

A. Prerequisites

(1) Assemble stage 6 turbine rotor assembly by Assembly-01 (Task 72-53-06-440-001).

B. Equipment And Materials Necessary

Standard Tools:

Drift, Fiber
Hammer, Soft Face or Plastic

Special Tools:

PWA 25648	Screw Set, Holding (2 Necessary)
PWA 32492	Screw Set (2 Necessary)
PWA 80258	Plug Set, Locating
PWA 85190	Adapter, Locating (Optional To PWA 87086)
PWA 85191	Plug Set, Holding
PWA 85192	Washer Set, Holding
PWA 85208	Weight, Calibration (Check Weight)
PWA 85592	Adapter, Lifting
PWA 87086	Adapter, Balance
PWA 87213	Pin, Alignment (4 Necessary)
PWA 101395	Drift, Removal/Installation
PWA 103649	Air Cylinder, Balance
PWA 104240	Adapter, Balance (Optional To PWA 85190 Or PWA 87086)

Consumable Materials:

Item No.	Designation
P05-026	Ink (PMC 4057-1)
P05-045	Marker (PMC 4092-1 or PMC 4092-2)
P05-323	Tape, Pressure Sensitive Sealing

C. Procedure

(1) Prepare the static balance locating adapter as follows:

(a) Use a hoist and sling and attach the PWA 85190 Locating Adapter or the PWA 87086 Balance Adapter to the spindle of the balance machine with the four detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the four bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(b) Install the PWA 85191 Holding Plug Set in the four threaded holes on the balance adapter marked 6LPT. Tighten the holding plugs hand tight.

(c) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(d) Install the PWA 80258 Locating Plugs in the four locations on the adapter marked 6LPT. Attach the plug set to the balance adapter with the two PWA 32492 Screw Sets.

(e) Adjust the four locating plugs for a loose fit. Turn the four plugs to align the zero (0) (marked on the adjusting collar) with the scribed radial lines passing through the center of the balance adapter.

NOTE: Set zero (0) toward the center of the balance adapter.

(2) Optional − Prepare the air cylinder and static balance adapter as follows:

(a) Use a hoist and sling and attach the PWA 103649 Balance Air Cylinder to the spindle of the balance machine with the six detail bolts.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(b) Use a hoist and sling and attach the PWA 104240 Balance Adapter to the air cylinder with the six detail bolts. See Figure 1001.

1 Use an opposite bolt pattern and tighten the six bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

(c) Turn the center bolt on the diaphragm fully clockwise (finger tight) to secure the diaphragm to the piston of the air cylinder.

(d) Install the detail slide clamps (marked LPT−6) onto the shoulder bolts and move the clamps inward toward the machine spindle.

(e) Turn the center cap screw on the air cylinder valve one full turn counter−clockwise.

(f) Turn the valve housing to OD and turn the center cap screw clockwise to tighten.

1 If the balance machine is equipped with air controls, turn the air control to "unclamp". If the balance machine is not equipped with air controls, attach an air hose to the fitting on the OD of the air cylinder.

(3) Install the rotor assembly on the PWA 85190 or PWA 87086 balance adapter and adjust the locating plugs for proper fit. See Figure 1002.

(a) Put the PWA 85592 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(b) Attach a hoist to the lift eye of the adapter and lift the assembly. Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(c) Do not remove the hoist from the lift eye or the adapter from the assembly at this time.

(d) Adjust the locating plug set for a light interference fit with the outside diameter of the rotor assembly.

(e) Carefully remove the assembly from the balance adapter. Do not disturb the setting on the locating plug set.

(f) Set the locating plugs for the proper fit. The four locating plugs must be set to the same numerical marking after adjusting for proper fit.

(g) Tighten the four screws that attach the locating plugs to the balance adapter.

NOTE: Do not disturb the numeric position of the locating plugs while you tighten the screws.

(h) Mark one hold down plug for reference with a Marker P05−045.

(i) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(j) Mark the disk in line with referenced mark on hold down plug with a Marker P05−045.

(k) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(l) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets. Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(4) Optional − Install the rotor assembly on the PWA 104240 Balance Adapter as follows:

(a) Lower the rotor assembly on the adapter, make sure to engage the two locating pins into the bolt circle of the disk.

(b) Reach through the bore of the disk and move the slide clamps radially outward.

(c) Turn the air control to "clamp", or remove the air hose from the OD of the cylinder to secure the rotor to the adapter.

(5) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(6) Turn the rotor assembly on the balance adapter 180 degrees from the original balance location as follows:

(a) Remove the screw sets and the washer set that attaches the rotor assembly to the adapter.

(b) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

(c) Put the PWA 85592 Lifting Adapter to the bore of the disk, with the lift eye up. Move the two detail clamps under the disk and tighten the hand knobs.

(d) Attach the hoist to the lift eye and carefully lift the rotor off the adapter, turn it 180 degrees.

(e) Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(f) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

(g) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets.

1 Matching screws must be used at diametrically opposite positions.

2 Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(7) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(8) If the static unbalance is equal to 1.0 oz−in. (720.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(b) If necessary, remove all ink markings of unbalance symbols (triangle) that were done before.

(9) If the static unbalance is more than 1.0 oz−in. (720.0 g.mm), continue as follows:

NOTE: It is desirable to reduce residual unbalance to lowest value possible in practical amount of time.

(a) Use the PWA 85592 Lifting Adapter to remove the rotor assembly from the balance adapter.

CAUTION: LIGHTLY HIT THE BLADE ROOT ONLY. YOU CAN EASILY DAMAGE THE AIRFOILS OR THE PLATFORMS OF THE BLADES IF THEY ARE HIT.

(b) Make a pyramid of the blades that must be removed. Lightly hit the blade root platforms with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to remove the blades.

CAUTION: BE VERY CAREFUL WHEN YOU SEAT THE BLADES OR DAMAGE TO THE BLADE TANGS CAN OCCUR.

(c) Lock the blade shrouds and engage the root of the blades into the disk. Lightly tap the blades with a PWA 101395 Installation Drift or a fiber drift and a soft face hammer to touch the blade tang against the disk.

STAGE 6 TURBINE ROTOR ASSEMBLY − ASSEMBLY−02

(d) Put the assembly on the balance adapter.

(e) Static balance the rotor assembly as described above until the residual unbalance is not more than 1.0 oz−in. (720.0 g.mm).

(f) Record the heavy angle and the amount of assembly unbalance.

(g) Make a record of the last blade positions.

(10) Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

(a) Install the PWA 85208 Calibration Weight (Check Weight) in one of the tiebolt holes on the front flange bolt circle as close as possible to the angle of residual unbalance.

(b) Attach the check weight to the disk with Pressure Sensitive Sealing Tape P05−323.

(c) The check weight pulls 2.0 oz−in. (1440.0 g.mm).

(d) Do a check of the balance machine at 900 rpm minimum.

(e) The amount of unbalance should pull 2.0 oz−in. (1440.0 g.mm) plus the remaining residual unbalance ± 0.4 oz−in. (288.0 g.mm).

(f) Remove the check weight.

(11) Ink mark unbalance symbol (triangle) on the rotor assembly using Ink P05−026 at heavy unbalance.

(12) Using hoist and PWA 85592 Adapter, remove rotor assembly from balance fixture.

(13) Store rotor assembly, front flange down. Remove adapter.

D. Postrequisites

(1) Final assemble stage 6 turbine rotor assembly by Assembly−03 (Task 72−53−06−440−003).

STAGE 6 TURBINE ROTOR ASSEMBLY - ASSEMBLY-03

Task 72-53-06-440-003:

1. Final Assemble 6th Stage Turbine Rotor Assembly
   - A. Prerequisites
     - (1) See Inspection/Check-04 (Task 72-53-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.
     - (2) Balance 6th stage turbine rotor assembly per Assembly-02 (Task 72-53-06-440-002).
   - B. Equipment And Materials Required

Special Tools:

PWA 85386 Support, Front
PWA 85592 Eye, Lifting
PWA 85900 Bender, Pneumatic
PWA 85961 Bender, Pneumatic

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Lock	128	72-53-00	6	80

   - C. Procedure
     - (1) Using hoist and PWA 85592 Lifting Eye position rotor, flange down, onto PWA 85386 Front Support. Remove hoist.
     - (2) Install blade locks into grooves between mating lugs at rear of blade root platform and disk.
     - (3) Prebend blade locks to requirements of Figure 1001. Use PWA 85961 Bender. Apply final bend with PWA 85900 Bender.
     - (4) Reconnect hoist to lifting eye. Lift assembly and store rotor assembly front end down on (PWA 85386) Front Support.

TURBINE EXHAUST CASE − HOW TO USE

Task 72−54−00−990−003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant Turbine Exhaust Case parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED − This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED − This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

TURBINE EXHAUST CASE − HOW TO USE

TURBINE EXHAUST CASE - DESCRIPTION/OPERATION-00

Task 72-54-00-990-006:

1. Turbine Exhaust Case

See Figure 1 and Figure 2.

A. General Operation

(1) The turbine exhaust case assembly is a main structural support member of the engine and provides a housing for the rear (LPT) shaft bearing (No. 4 bearing). This structural case provides the aft attachment point for the power plant to the aircraft pylon (strut). Rear ground handling tool attachment points are also located on this case.

(2) The turbine exhaust case is the transition duct for the exhaust gas flow from divergent (through the turbines) to convergent (through the exhaust nozzle).

B. Description

(1) The turbine exhaust case is constructed of greek ascoloy stainless steel material and is welded together as a concentric inner cone segment and outer duct ring joined by fifteen airfoil shaped radial struts. Two circumferential rails on the OD of the case provide structural stiffness to the outer duct and provide mounting points for the rear of the engine, on the aircraft strut and for ground handling.

(2) Provisions are made in the rear mount rails for the attachment of the engine (lower) aft mount links to carry engine vertical, side and torsional loads to the airframe structure.

(3) The engine rear ground handling provisions consist of two holes through the rear mount rail on the horizontal centerline.

(4) Probes are installed between the exhaust case struts at four locations. At two locations probes measure gaspath total temperature (TT4.95). At the other two locations, probes measure gaspath total temperature and total gaspath pressure.

TURBINE EXHAUST CASE − DESCRIPTION/OPERATION−00

(5) The inner cone portion of the case provides support for the No. 4 bearing, with load forces transmitted from the bearing, through the struts to the outer case structure. No. 4 bearing oil pressure and scavenge tubes are routed within case struts at the 1:30 and 2:30 o'clock locations respectively.

TURBINE EXHAUST CASE - DISASSEMBLY-01

Task 72-54-00-030-001:

1. Disassemble Turbine Exhaust Case

A. Equipment And Materials Required

Special Tools:

PWA 25039	Stand
PWA 25040	Bracket, Support (Optional to PWA 85195 Bracket for engines with exhaust nozzle removed)
PWA 25041	Bracket, Support (Optional to PWA 85195 Bracket for engines with exhaust nozzle removed)
PWA 28657	Sling, Handling
PWA 76154	Adapter (2 Required)
PWA 85195	Bracket, Support (2 Required)
PWA 85446	Puller, Jackscrew

B. Procedure

NOTE: Turbine exhaust case group is positioned on pallet front end down.

Subtask 72-54-00-030-051:

(1) Install PWA 85195 Support Brackets to turbine exhaust case at 3 and 9 o'clock locations.

NOTE: See following step for optional bracket installation.

(a) Position bracket between case rails and align holes with bushings.

(b) Install pins from rear through bushings and bracket.

(c) Secure pins with safety pins.

(d) Repeat procedure for opposite bracket location.

(2) Install PWA 25040 and PWA 25041 Brackets to turbine exhaust case at 3 and 9 o'clock locations.

(a) Align boltholes and position PWA 25040 Bracket on left side (9 o'clock position) between case rails. Secure bracket to case with detail ball lock pin.

R
R

(b) Align boltholes and position PWA 25040 Bracket on right side (3 o'clock position) between case rails. Secure bracket to case with detail ball lock pin.

(3) Install turbine exhaust case in PWA 25039 Build Stand.

(a) Move vertical upright in desired position on rail and secure.

(b) Attach PWA 28657 Sling to hoist. Attach sling to outer spools of brackets on turbine exhaust case with two PWA 76154 Adapters.

(c) Lift and position turbine exhaust case on build stand cradling inner spools of brackets. Remove sling and adapters.

(d) Install ball lock pin in left bracket flange.

(e) Secure clamp on top of vertical support to retain spools.

Subtask 72−54−00−030−052:

(4) (Pre SB PW4ENG 79−76) Remove No. 4 bearing (oil) pressure tube. See Figure 501.

(a) Remove lockwire (501/12) securing heat shields to the No. 4 oil pressure tube (501/7).

(b) Separate and remove heat shields (501/8) and (501/11) from tube.

(c) Remove lockwire and bolts (501/6) securing No. 4 bearing tube guide (501/5) to case.

(d) Disconnect nut securing tube (501/7) to adapter (501/10) in inner rear flange of exhaust case.

(e) Remove thrust wire (501/2) securing nut (501/1) to tube (501/7). Remove nut.

(f) Remove lockwire and bolts (501/3) securing No. 4 bearing pressure tube shield (501/4) to exhaust case at 10:30 o'clock position as viewed from rear.

(g) Move tube (501/7) radially inward and remove tube from case. Remove optional fiberglass wear wrap if necessary.

(h) Remove adapter (501/10) and packing (501/9). Discard packing.

(5) (Post SB PW4ENG 79-76) Remove No. 4 bearing (oil) pressure tube. See Figure 502.

(a) Remove the No. 4 pressure tube (502/10) from the turbine exhaust case at the 4:30 o'clock position.

1 Remove two bolts (502/1) that attach the tube shield (502/16) and bracket (502/2) to the turbine exhaust case.

2 Remove the tube shield (502/16), bracket (502/2), thrust wire (502/18) and nut (502/17) from the outboard end of the pressure tube.

3 Remove the bolt (502/6) and nut (502/12) that attach the tube to the bracket (502/8).

4 Remove the tube nut from the adapter (502/14) and move the tube radially inward and remove the pressure tube from the case.

(b) Cut the restraining straps (502/3) and remove the insulation slide clamp (502/13) and shield sets (502/9) and (502/4) from the tube.

(c) Remove the optional fiberglass wear wrap from the tube if necessary.

(d) Remove bolts (502/5) and bracket (502/8) from the turbine exhaust case.

(e) Remove adapter (502/14) and packing (502/15). Discard the packing.

Subtask 72-54-00-030-053:

(6) (Pre SB PW4ENG 72-472) Remove the No. 4 bearing (oil) nozzle and No. 4 bearing packing transfer tube from boss in the exhaust case (No. 4 bearing compartment) at 1:30 o'clock position. See Figure 503.

(a) Remove bolts (503/8) and key washers (503/6) and (503/7) securing No. 4 bearing packing transfer tube (503/5) to No. 4 bearing nozzle (503/4). Remove tube.

(b) Remove bolts (503/1) and key washers (503/2) and (503/3) securing No. 4 bearing nozzle (503/4) to exhaust case. Remove nozzle.

Subtask 72-54-00-030-058:

(7) (Post SB PW4ENG 72-472) Remove the No. 4 bearing (oil) nozzle and front No. 4 bearing nozzle. See Figure 504.

(a) Remove the bolts and key washer (504/1) that attach the front No. 4 bearing nozzle to the No. 4 bearing support flange at the 12 o'clock position. Discard the key washer.

(b) Move the packing transfer tube (504/15) into the elbow of the No. 4 bearing damper supply tube (504/12). Remove the nozzle.

(c) Remove the packing transfer tube from the damper supply tube. Discard the two packings (504/14).

(d) Remove the bolts and key washers (504/16) and (504/17) that attach the No. 4 bearing damper supply tube (504/12) to the No. 4 bearing oil nozzle (504/11). Remove the tube.

(e) Remove the bolts and key washers (504/16) and (504/17) that attach the No. 4 bearing nozzle (504/11) to the exhaust case. Remove the nozzle.

Subtask 72-54-00-030-054:

(8) (Pre SB PW4ENG 79-76) Remove No. 4 bearing scavenge tube (outer). See Figure 505.

(a) Remove lockwire (505/8) laced through eyelets in heat shield.

(b) Separate and remove heat shields (505/9) and (505/12) from the No. 4 bearing scavenge tube (505/7).

(c) Remove lockwire and bolts (505/6) securing No. 4 bearing tube guide (505/5) to case.

(d) Remove thrust wire (505/2) securing nut (505/1) to tube (505/7). Remove nut.

(e) Move tube (505/7) radially inward and remove tube from case. Remove optional fiberglass wear wrap if necessary.

(f) Remove adapter (505/10) from exhaust case inner flange at 7:30 o'clock location. Discard packing (505/11).

(9) (Post SB PW4ENG 79-76) Remove No. 4 bearing scavenge tube (outer). See Figure 506.

(a) Remove the No. 4 scavenge tube (506/10) from the turbine exhaust case at the 4:00 o'clock position.

1 Remove two bolts (506/1) that attach the tube shield (506/16) and bracket (506/2) to the turbine exhaust case.

2 Remove the tube shield (506/16), bracket (506/2), thrust wire (506/18) and nut (506/17) from the outboard end of the pressure tube.

3 Remove the bolt (506/6) and nut (506/12) that attach the tube to the bracket (506/8).

4 Remove the tube nut from the adapter (506/14) and move the tube radially inward and remove the scavenge tube from the case.

(b) Cut the restraining straps (506/3) and remove the insulation slide clamp (506/13) and shield sets (506/9) and (506/4) from the tube.

(c) Remove the optional fiberglass wear wrap from the tube if necessary.

(d) Remove bolts (506/5) and bracket (506/8) from the turbine exhaust case.

(e) Remove adapter (506/14) and packing (506/15). Discard the packing.

TURBINE EXHAUST CASE - DISASSEMBLY-01

(10) For engines that do not incorporate the reduced weight exhaust case (Pre SB PW4ENG 72-456) remove the No. 4 bearing housing rear heat shields. See Figure 507.

(a) Remove the retaining strap (507/3) from the (rear outer) heat shield (507/2).

(b) Remove the (rear outer) heat shield (507/2) and the two (filler) heat shield segments (507/1).

(c) Remove the two No. 4 bearing (front) heat shields (507/4) from the OD of the No. 4 bearing housing.

(11) For engines that incorporate the reduced weight exhaust case (Post SB PW4ENG 72-456) remove the No. 4 bearing housing rear heat shields.

(a) Remove the retaining strap (507/6) from the No. 4 bearing (rear outer) heat shield (507/5).

(b) Remove the (rear outer) heat shield from the No. 4 bearing housing.

(c) Remove the two No. 4 bearing (front) heat shields (507/7) from the OD of the No. 4 bearing housing.

Subtask 72-54-00-030-055:

(12) Remove No. 4 bearing outer race and rollers. See Figure 508.

(a) Remove bolts (508/6) and key washers (508/4) and (508/5) securing the No. 4 bearing retaining plates (508/3) to rear face of exhaust case inner flange.

(b) Position four legs of PWA 85446 Jackscrew Puller into slots in bearing outer race and rotate to secure legs in puller groove of bearing.

(c) Hold center handle of puller and turn large jacking nut to remove outer race from exhaust case. Remove puller. Remove two seal rings (508/1).

CAUTION: BEARING INNER RACE IS INSTALLED ON FRONT COMPRESSOR DRIVE TURBINE SHAFT. ENSURE THAT ALL BEARING DETAILS ARE KEPT TOGETHER. MIXING OF BEARING DETAILS MAY CAUSE DAMAGE TO BEARING.

(d) Place No. 4 bearing outer race and rollers into suitable container.

(13) For engines without the revised TT4.95 cable and PT4.95 sensing manifold for increased engine core clearance (Pre SB PW4ENG 72-134), remove thermocouple box and cable assembly (EGT TT4.95). See Figure 509 (Sheet 1), Figure 509 (Sheet 2)and Figure 510.

(a) Remove four nuts (509/1) and (509/2) and washers (509/4 and 509/3) securing harness to thermocouple connections. Remove harness ends from thermocouple and reinstall washers and nuts on thermocouple connections. Comply with this step at four thermocouple locations.

(b) Remove bolts (509/5) and nuts (509/6) securing harness to all brackets and adjacent PT4.95 manifold clamps.

(c) Remove four bolts securing inner front bracket (510/4) and inner rear bracket (510/8) to outer support (510/5) at approximately 7 o'clock position on exhaust case. Remove inner brackets. See Figure 510.

(d) Remove two bolts (510/7) securing rear of outer support to bracket on Flange T. Remove support.

(e) Remove four nuts (510/2) securing box and cable assembly cover (510/3) to bracket (510/1) on Flange P. Remove box and cable assembly.

(14) For engines with the revised TT4.95 cable and PT4.95 sensing manifold for increased engine core clearance (Post SB PW4ENG 72-134), remove the thermocouple box and cable assembly (EGT TT4.95). See Figure 511.

(a) Remove the four nuts and lockwashers that attach the cable leads to the thermocouple terminal studs. Remove the cable leads from the studs. Install the lockwashers and nuts on the studs. Do this step at the four thermocouple locations. See Views A, C, E, and I.

(b) Remove the nut, bolt, and clamps that attach the bottom two leads to the EEC PT4.95 manifold at the 4:30 o'clock thermocouple. See View C.

(c) Remove the nut, bolt, and clamp that attach the top two leads to the bracket on the EEC PT4.95 tube at the 10 o'clock thermocouple. See View E.

(d) Remove the nut, bolt, spacer, and clamp that attach the bottom two leads to the bracket at the 7 o'clock thermocouple. See View I.

(e) Remove the bolts and nut that attach the positioning plate to the support bracket at approximately the 5 o'clock position. Remove the positioning plate. See View D.

(f) Remove the bolts that attach the front positioning plate to the front support bracket. Remove the positioning plate. See View J.

(g) Remove the bolts that attach the rear positioning plate to the rear support bracket. Remove the positioning plate. See View J.

(h) Remove the lockwire and bolt that attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position. See View E.

(i) Remove the bolts and nuts that attach the cable clamps to all brackets and adjacent PT4.95 tube/manifold clamps.

(j) Remove the nuts that attach the box and cable assembly to the bracket on Flange P. Remove the box and cable assembly from the engine. See View J.

(15) For engines with the one piece EEC PT4.95 manifold assembly (512/1) (Pre SB PW4ENG 72−134), remove the EEC PT4.95 manifold assembly as follows. See Figure 512.

TURBINE EXHAUST CASE - DISASSEMBLY-01

(a) Remove the lockwire. Disconnect the two manifold nuts (512/7) at the probe adapters.

(b) Remove the bolts (512/4), nuts (512/3), and clamps (512/2) that attach the manifold. Remove the manifold.

(c) Remove the plug (512/5) and washer (512/6) from the manifold. Install the covers.

(16) For engines with the three piece EEC PT4.95 manifold (Post SB PW4ENG 72-134), remove the two EEC PT4.95 manifold assemblies (513/1 and 513/2) and the EEC PT4.95 tube assembly (513/3) as follows. See Figure 513.

(a) Remove the lockwire. Disconnect the tube and manifold nuts (513/9) at the probes and from each other.

(b) Remove the bolts (513/6), nuts (513/5), and clamps (513/4) that attach the manifolds and tubes. Remove the two manifolds (513/1 and 513/2) and the tube (513/3).

(c) Remove the plug (513/8) and washer (513/7) from the manifold (513/2). Install the covers.

(17) Remove TT4.95 exhaust gas temperature thermocouple and thermocouple housing assembly from exhaust case at 1 o'clock position. See Figure 514.

(a) Remove lockwire and bolts (514/1) securing thermocouple (514/4) to thermocouple housing assembly (514/5) and exhaust case. Remove bracket (514/3) and thermocouple from thermocouple housing.

(b) Remove bolt (514/2) securing thermocouple housing to exhaust case. Remove thermocouple housing from case.

(18) Remove TT4.95 exhaust gas temperature thermocouple and thermocouple housing assembly from exhaust case at 6:30 o'clock position. See Figure 515.

(a) Remove lockwire and bolts (515/4) securing thermocouple (515/2) to thermocouple housing and exhaust case. Remove bracket (515/3) and thermocouple from thermocouple housing.

(b) Remove bolt (515/5) securing thermocouple housing to exhaust case. Remove thermocouple housing from case.

(19) Remove TT4.95 exhaust gas temperature thermocouple and average pressure and temperature probe from exhaust case at 4:30 o'clock position. See Figure 516.

(a) Remove lockwire and bolts (516/5) securing thermocouple (516/2) to average pressure and temperature probe and exhaust case. Remove bracket (516/4) and thermocouple from probe.

(b) Remove bolt (516/3) securing average pressure and temperature probe (516/1) to exhaust case. Remove probe from case.

(20) Remove TT4.95 exhaust gas temperature thermocouple and average pressure and temperature probe from exhaust case at 10 o'clock position. See Figure 517.

(a) Remove lockwire and bolts (517/3) securing thermocouple (517/4) to average pressure and temperature probe and exhaust case. Remove thermocouple from probe.

(b) Remove bolt (517/2) securing average pressure and temperature probe (517/1) to exhaust case. Remove probe from case.

Subtask 72−54−00−030−057:

(21) Drill out rivet/plugs in the outer case wall at the 13 strut locations as specified in Figure 518. Do not damage the case parent metal.

NOTE: If the rivet/plugs are not there, you must drill purge and drain holes. Refer to 72−54−01, Repair−25 (Task 72−54−01−300−025).

Subtask 72−54−00−030−056:

(22) Remove turbine exhaust case from build stand.

TURBINE EXHAUST CASE − DISASSEMBLY−01

(a) Remove ball lock pin from left bracket flange.

(b) Open clamp securing flange brackets to vertical supports of build stand.

R (c) Attach PWA 28657 Sling to hoist. Attach sling to outer spools of brackets on turbine exhaust case with PWA 76154 Adapters.

(d) Lift and trunnion case to rear end down position and lower onto pallet. Remove hoist, sling, adapters and brackets from case.

TURBINE EXHAUST CASE − INSPECTION/CHECK−01

Task 72−54−00−990−004:

1. General Inspection Requirements − Turbine Exhaust Case

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check−00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check−00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check−01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check−02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

TURBINE EXHAUST CASE − INSPECTION/CHECK−01

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−54−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−54−99 is limited to cleaning, nondestructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

TURBINE EXHAUST CASE − INSPECTION/CHECK−01

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

   (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

   (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

TURBINE EXHAUST CASE − INSPECTION/CHECK−03

Task 72−54−00−990−005:

1. Visual Inspection − Turbine Exhaust Case
   A. For inspection requirements applicable to installed (accessible) parts of turbine exhaust case see:
      −72−00−54, Inspection/Check−03 (Task 72−00−54−210−001) for EGT (TT4.95) Thermocouple Housing
      −72−00−54, Inspection/Check−04 (Task 72−00−54−210−002) for Exhaust Gas Average Pressure (And Thermocouple Housing) PT4.95 Probe
      −72−00−54, Inspection/Check−05 (Task 72−00−54−210−003) for EGT (TT4.95) Thermocouple
      −72−00−54, Inspection/Check−06 (Task 72−00−54−210−004) for EGT (TT4.95) Box And Cable.

Previous Pageblock Return to Previous Menu Next Pageblock

TURBINE EXHAUST CASE - INSPECTION/CHECK-04

Task 72-54-00-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

Task 72–54–00–400–001:

1. Assemble Turbine Exhaust Case

A. Prerequisites

(1) See Inspection/Check–04 Task 72–54–00–990–001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Cherry Max Rivet Gun and head for 1/4 inch (6.350 mm) max. rivets	Cherry Division of Textron, Inc., 1224 East Warner Ave., Box 2157, Santa Ana, CA 92707–0157

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

CTE 5070	Airflow Cart (Optional to CTE 6070)
CTE 6070	Airflow Cart
PWA 25039	Stand
PWA 25040	Bracket, Support (Optional to PWA 85195 Bracket for engines with exhaust nozzle removed)
PWA 25041	Bracket, Support (Optional to PWA 85195 Bracket for engines with exhaust nozzle removed)
PWA 28657	Sling, Handling
PWA 76154	Adapter (2 Required)
PWA 85195	Bracket, Support (2 Required)
PWA 85501	Adapter

TURBINE EXHAUST CASE - ASSEMBLY-01

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-136	Fiberglass Wrap (Optional)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-023	Silver Goop (PWA 36001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-54-00/5/1
Key Washer	4	72-54-00/4/60
Key Washer	4	72-54-00/4/70
Key Washer	3	72-54-00/5/20
Key Washer	2	72-54-00/5/60
Key Washer	2	72-54-00/5/70
Packing	1	72-54-00/2/1
Packing	1	72-54-00/3/1
Thrust Wire	1	72-54-00/2/110
Thrust Wire	1	72-54-00/3/110

Lockwire, PN MS9226-03
Rivet, PN 50P308

C. Assemble Turbine Exhaust Case

Subtask 72-54-00-430-051:

(1) Install PWA 85195 Support Brackets to turbine exhaust case at 3 and 9 o'clock locations.

NOTE: See following step for optional bracket installation.

(a) Position bracket between case rails and align holes with bushings.

(b) Install pins from rear through bushings and bracket.

(c) Secure pins with safety pins.

(d) Repeat procedure for opposite bracket location.

(2) Install PWA 25040 Brackets and PWA 25041 Brackets to turbine exhaust case at 3 and 9 o'clock locations.

NOTE: Do not use the PWA 25040 Brackets and PWA 25041 Brackets in place of PWA 85195 Brackets if the brackets are not removed prior to the exhaust nozzle installation.

(a) Align boltholes and position PWA 25040 Bracket on left side (9 o'clock position) between case rails. Secure bracket to case with detail ball lock pin.

(b) Align boltholes and position PWA 25040 Bracket on right side (3 o'clock position) between case rails. Secure bracket to case with detail ball lock pin.

(3) Install turbine exhaust case in PWA 25039 Build Stand.

(a) Move vertical upright in desired position on rail and secure.

(b) Attach PWA 28657 Sling to hoist. Attach sling to outer spools of brackets on turbine exhaust case with two PWA 76154 Adapters.

(c) Lift and position turbine exhaust case on build stand cradling inner spools of brackets. Remove sling and adapters.

(d) Install ball lock pin in left bracket flange.

(e) Secure clamp on top of vertical support to retain spools.

Subtask 72−54−00−430−052:

(4) Install No. 4 bearing outer race and rollers.

CAUTION: BEARING INNER RACE IS INSTALLED ON FRONT COMPRESSOR DRIVESHAFT. ENSURE THAT ALL BEARING DETAILS ARE KEPT TOGETHER. MIXING OF BEARING DETAILS MAY CAUSE DAMAGE TO BEARING.

(a) Remove No. 4 bearing outer race and rollers from container.

(b) Install two seal rings (1001/1) into grooves in OD of bearing outer race. See Figure 1001. Position the seal ring gaps within Area E, 180 degrees from the No. 4 bearing (oil) nozzle, as shown in Figure 1002.

(c) Align four slots in rear face of bearing outer race with slots in exhaust case inner flange rear face and install bearing outer race with rollers into No. 4 bearing support flange in exhaust case.

(d) Secure outer race using four retaining plates (1001/3) (chamfered side out), eight bolts (1001/5) lubricated with Engine Oil P03−001, and key washers (1001/4). Omit the retaining plate located at the 12 o'clock position until after the No. 4 bearing front nozzle is installed.

(e) (Reference 90) Make sure that the clearance between the retaining plate and the grooves in the bearing outer race is in the limit specified in Index 2, Figure 1002.

(f) With retaining plate gaps within limits given in previous step, torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m). Recheck gap per previous step.

(g) Bend tabs of washers to secure bolts.

Subtask 72−54−00−430−053:

(5) (Pre SB PW4ENG 79−76) Install No. 4 bearing oil scavenge (inner) tube (1004/8) and (outer) tube (1004/15). See Figure 1004.

(a) Install adapter (1004/1), lubricated with Engine Oil P03−001, and new packing (1004/2) into threaded hole in rear inner flange of exhaust case at 7:30 o'clock position. Torque adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(b) Install new gasket (1004/3) in groove in recess in exhaust case rear inner diameter.

(c) Align boltholes in flange of No. 4 bearing oil scavenge tube (1004/8) with boltholes in recessed pad in exhaust case rear inner diameter. Align bolthole in detail tube bracket with bolthole in exhaust case rear inner diameter. Secure tube using three bolts (1004/6) lubricated with Engine Oil P03−001 and key washers (1004/7). Torque bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Bend tabs of key washers.

(d) No. 4 bearing scavenge tube option to prevent possible wear to the No. 4 bearing scavenge tube (1004/15), a fiberglass tape wear Wrap P05−136, (1004/19) is provided as an option.

(e) Install No. 4 bearing tube guide (1004/13) onto scavenge tube (1004/15). Install scavenge tube, straight end, into opening in exhaust case inner wall and through strut at approximately 10:30 o'clock location as viewed from the rear. Handtighten tube nut detail lubricated with Engine Oil P03−001, to secure tube to adapter (1004/1) on rear inner flange of exhaust case at 7:30 o'clock location as viewed from rear.

(f) Secure tube guide to boss on inner wall of exhaust case using two bolts (1004/14) lubricated with Engine Oil P03−001. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m). Safety the bolts using Lockwire P05−289.

(g) Torque the nut on the inboard end of the scavenge tube to the adapter (1004/1) to 320 − 350 lb−in. (36.155 − 39.545 N.m) and safety the nut to the adapter with Lockwire P05−289.

(h) Position the nut (1004/9) onto the outboard end of scavenge tube (1004/15). Safety the nut to tube using thrust wire (1004/10).

(i) Position No. 4 bearing scavenge tube heat shields (1004/16) and (1004/17) around inboard end of tube. Secure heat shields using lockwire PN MS 9226−03 laced through eyelets in heat shield. See 70−53, Standard Practices Manual, PN 585005.

(6) (Post SB PW4ENG 79−76) Install No. 4 bearing oil scavenge (inner) tube (1005/8) and (outer) tube (1005/9). See Figure 1005.

(a) Install adapter (1005/1), lubricated with Engine Oil P03−001, and new packing (1005/2) into threaded hole in rear inner flange of exhaust case at 7:30 o'clock position. Torque adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(b) Install new gasket (1005/3) in groove in recess in exhaust case rear inner diameter.

(c) Align boltholes in flange of No. 4 bearing oil scavenge tube (1005/8) with boltholes in recessed pad in exhaust case rear inner diameter. Align bolthole in detail tube bracket with bolthole in exhaust case rear inner diameter. Secure tube using three bolts (1005/6) lubricated with Engine Oil P03−001 and key washers (1005/7). Torque bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Bend tabs of key washers.

(d) No. 4 bearing scavenge tube option to prevent possible wear to the No. 4 bearing scavenge tube (1005/9), a fiberglass tape wear Wrap P05−136, (1005/23) is provided as an option.

(e) Install the shield set (1005/10) and the heat shield insulation slide clamp (1005/11) on the elliptical section of the No. 4 scavenge tube (1005/9).

NOTE: The shield is installed on the section of the tube that goes through the strut of the turbine exhaust case.

(f) Install the shield set (1005/12) on the No. 4 scavenge tube as follows.

1 Place the two halves over the round section of tube.

2 Install one restraining strap (1005/13) through the loops on the section of the shield that overlaps the shield set (1005/10).

3 Put the loop clamp (1005/14) on the wear sleeve of the shield set and secure temporarily with a work bolt and nut.

4 Make tight the shield set on the tube by pulling the strap tight. Cut off excess strap material.

(g) Attach bracket (1005/15) to the turbine exhaust case with two bolts (1005/16). Torque the bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(h) Install the No. 4 scavenge tube through the strut at the 4:00 o'clock position.

1 Attach the tube nut to the adapter (1005/1), handtight.

NOTE: The shield may be separated to attach the tube nut to the adapter.

2 Remove the work bolt and replace with bolt (1005/17) and nut (1005/18) and attach to the bracket (1005/15).

3 Torque the nut on the inboard end of the scavenge tube to the adapter (1005/1) to 225 − 250 lb−in. (25.422 − 28.246 N.m). Safety the tube nut with Lockwire P05−289.

4 Torque the bolt (1005/17) that attaches the clamp (1005/17) to the bracket (1005/15) to 32 − 36 lb−in. (3.616 − 4.067 N.m).

5 Install the four additional straps (1005/13) to hold the shield in place.

6 Make tight the shield set on the tube by pulling the straps tight. Cut off excess strap material.

7 Position the nut (1005/19) onto the outboard end of the scavenge tube and safety the nut with thrust wire (1005/20).

8 Attach the tube shield (1005/21) to the turbine exhaust case at the 4:00 o'clock position, pushing it on over the nut (1005/19).

9 Install two bolts (1005/22) to retain shield and torque to 32 - 36 lb-in. (3.616 - 4.067 N.m). Safety the bolts with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(7) For engines that do not incorporate the reduced weight exhaust case (Pre SB PW4ENG 72-456) install the No. 4 bearing compartment rear heat shields. See Figure 1003.

(a) Put the two No. 4 bearing (front) heat shields (1003/4) around the OD of the No. 4 bearing housing.

(b) Align the clearance radii of the No. 4 bearing (filler) heat shield (1003/1) with the mating scalloped contour of the No. 4 bearing housing, and install the No. 4 bearing (rear outer) heat shield (1003/2) over the rear inner heat shields and (filler) heat shields.

(c) Install the retaining strap (1003/3) through the four loops in the (rear outer) heat shield and insert the end in the buckle and pull to tighten the strap.

(8) For engines that incorporate the reduced weight exhaust case (Post SB PW4ENG 72-456), install the No. 4 bearing compartment rear heat shields. See Figure 1003.

(a) Put the two No 4 bearing (front) heat shields (1003/7) around the OD of the No. 4 bearing housing.

(b) Align the clearance radii of the No. 4 bearing (rear outer) heat shield (1003/5) with their mating tube bosses and install the (rear outer) heat shield over the (front) heat shields.

(c) Install the retaining strap (1008/6) through the four loops in the (rear outer) heat shield and insert the end in the buckle, and pull to tighten the strap.

Subtask 72−54−00−430−061:

(9) Install No. 4 bearing (oil) nozzle and No. 4 bearing damper supply tube. See Figure 1006.

(a) Install the No. 4 bearing nozzle (1006/11) in the port in the pad on the exhaust case rear inner diameter at the 1:30 o'clock position. Install the nozzle with two bolts (1006/16) and (1006/17), with threads lubricated with Engine Oil P03−001, and two washers (1006/16) and (1006/17).

(b) Install the No. 4 bearing damper supply tube (1006/12) through the 0.380 inch (9.652 mm) diameter hole in the nozzle (1006/11) and into the port in the exhaust case rear flange. Install the damper tube with two bolts (1006/16) and (1006/17), with threads lubricated with Engine Oil P03−001, and washers (1006/16) and (1006/17). Torque the bolts that attach the nozzle to the exhaust case and bolts that attach the damper supply tube to the nozzle to 75 − 85 lb−in. (8.474 − 9.604 N.m). Bend the tabs of washers.

Subtask 72−54−00−430−062:

(10) Install No. 4 bearing front nozzle assembly and the packing transfer tube (damper tube to front nozzle). See Figure 1006.

(a) Lubricate two packings (1006/14) with Engine Oil P03−001. Install the packings in the grooves of the packing transfer tube (1006/15). Insert one end of the tube into the port in the front No. 4 bearing nozzle (1006/13).

(b) Align the boltholes in the flange of the front nozzle with the two retainer plate boltholes at the 12 o'clock position and insert the nozzle through the hole in the No. 4 bearing support flange at the 1:30 o'clock position. Insert the end of the transfer tube in the port in the elbow of the No. 4 bearing damper supply tube. Put the retaining plate (1006/2), chamfered side out, on the retainer plate pad (under the nozzle flange). Put the key washer (1006/1) over the oil nozzle flange, and install two bolts, with threads lubricated with Engine Oil P03−001.

(c) (Reference 90) Make sure that the clearance gap (1006/3) between the retaining plate and the grooves in the bearing outer race is in the limit specified in Index 2, Figure 1002. Torque the bolts that attach the retainer plate to 75 − 85 lb−in. (8.474 − 9.604 N.m). Bend the tabs of washer (1006/1).

Subtask 72−54−00−430−055:

(11) (Pre SB PW4ENG 79−76) Install No. 4 bearing (oil) pressure tube. See Figure 1007.

(a) Install adapter (1007/10), lubricated with Engine Oil P03−001, and new packing (1007/9) into threaded hole in rear inner flange of exhaust case at 1:30 o'clock position. Torque adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(b) No. 4 bearing pressure tube option to prevent possible wear to the No. 4 bearing pressure tube (1007/7), a fiberglass tape wear Wrap P05−136, (1007/13) is provided as an option.

(c) Install No. 4 bearing tube guide (1007/5) onto No. 4 bearing pressure tube (1007/7). Install pressure tube, straight end, into opening in exhaust case inner wall and through strut at approximately 1:30 o'clock location as viewed from front. Handtighten tube nut detail, lubricated with Engine Oil P03−001, to secure tube to adapter (1007/10) on rear inner flange of exhaust case at 1:30 o'clock as viewed from rear.

(d) Secure tube guide to boss on inner wall of exhaust case using two bolts (1007/6) lubricated with Engine Oil P03−001. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m). Safety the bolts using Lockwire P05−289.

(e) Torque tube nut detail to 320 − 350 lb−in. (36.155 − 39.545 N.m). Safety the tube nut with Lockwire P05−289.

(f) Position No. 4 bearing pressure tube shield (1007/4) onto boss on exhaust case outer wall at approximately 1:30 o'clock location as viewed from front. Secure tube shield using two bolts (1007/3). Torque bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(g) Position nut (1007/1) onto outboard end of pressure tube (1007/7). Secure nut to tube using thrust wire (1007/2).

(h) Position No. 4 bearing pressure tube heat shields (1007/8) and (1007/11) around inboard end of tube. Secure heat shields using lockwire PN MS9226-03 (1007/12) laced through eyelets in heat shield. See 70-53, Standard Practices Manual, PN 585005.

(12) (Post SB PW4ENG 79-76) Install No. 4 bearing (oil) pressure tube. See Figure 1005 (Sheets 2 and 3) and Figure 1008.

(a) Install adapter (1008/5), lubricated with Engine Oil P03-001, and new packing (1008/6) into threaded hole in rear inner flange of exhaust case at 1:30 o'clock position. Torque adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m).

(b) No. 4 bearing pressure tube option to prevent possible wear to the No. 4 bearing pressure tube (1008/14), a fiberglass tape wear Wrap P05-136, (1008/17) is provided as an option.

(c) Install the shield set (1008/15) and the heat shield insulation slide clamp (1008/16) on the
R elliptical section of the No. 4 pressure tube (1008/14).

NOTE: The shield is installed on the section of the tube that goes through the strut of the turbine exhaust case.

(d) Install the shield set (1008/7) on the No. 4 pressure tube as follows.

1 Place the two halves over the round section of tube.

2 Install one restraining strap (1008/18) through the loops on the section of the shield that overlaps the shield set (1008/15).

3 Make tight the shield set on the tube by pulling the strap tight. Cut off excess strap material.

4 Put the loop clamp (1008/10) on the wear sleeve of the shield set and secure temporarily with a work bolt and nut.

(e) Attach bracket (1008/11) to the turbine exhaust case with two bolts (1008/8). Torque the bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(f) Install the No. 4 pressure tube through the strut at the 4:30 o'clock position.

1 Attach the tube nut to the adapter (1008/5), handtight.

NOTE: The shield may be separated to attach the tube nut to the adapter.

2 Remove the work bolt and replace with bolt (1008/9) and nut (1008/12) and attach to the bracket (1008/11).

3 Torque the tube nut to the adapter (1008/5) to 225 − 250 lb−in. (25.422 − 28.246 N.m). Safety the tube nut with Lockwire P05−289.

4 Torque the bolt (1008/9) that attaches the clamp (1008/10) to the bracket (1008/11) to 32 − 36 lb−in. (3.616 − 4.067 N.m).

5 Install the four additional straps (1008/18) to hold the shield in place.

6 Make tight the shield set on the tube by pulling the straps tight. Cut off excess strap material.

7 Install bracket (1008/2) over the outboard end of the tube.

8 Position the nut (1008/4) on the outboard end of the tube and secure the nut to the tube with thrust wire (1008/19).

9 Attach the tube shield (1008/3) to the turbine exhaust case at the 4:30 o'clock position, pushing it on over the nut (1008/4). Line up the shield with the bracket (1008/2).

10 Install two bolts (1008/1) to retain shield and bracket and torque to 32 - 36 lb-in. (3.616 - 4.067 N.m). Safety the bolts with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(13) Install brackets to rear flange of exhaust case. See Figure 1009 for bracket locations. Lubricate threads of screws with Engine Oil P03-001. Secure brackets with screws and nuts. Torque screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

Subtask 72-54-00-430-058:

(14) Airflow check No. 4 bearing oil nozzle. See Figure 1006 (Sheet 3).

(a) Secure PWA 85501 Adapter to No. 4 bearing pressure tube located on outside of exhaust case at 10 o'clock position.

(b) Secure air inlet hose from CTE 5070 Airflow Cart or CTE 6070 to larger threaded hole of adapter.

(c) Secure pressure sensing line to remaining threaded hole on side of adapter.

(d) Airflow check nozzle at 10 psig (68.9 kPa). Airflow rate must be 6 - 20 lb/hr (2.72 - 9.07 kg/hr) for engines (Pre and Post SB PW4ENG 72-472).

(e) After airflow rate limits have been met, remove adapter and airflow cart from exhaust case.

(f) Make sure that the oil passage is not blocked.

Subtask 72−54−00−430−057:

(15) Install thermocouple housing assembly (1010/5) and thermocouple (1010/4) into exhaust case boss at approximately 1 o'clock position. See Figure 1010.

(a) Align boltholes and install thermocouple housing into exhaust case boss. Install one bolt (1010/2) threads lubricated with Silver Goop P06−023, at upper front (scalloped) bolthole location. Handtighten bolt.

(b) Align boltholes and install thermocouple (1010/4) into thermocouple housing. Position bracket (1010/3) over thermocouple and install two bolts (1010/1), threads lubricated with Silver Goop P06−023. Handtighten bolts.

(c) Torque all bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(16) Install thermocouple housing assembly (1011/1) and thermocouple (1011/2) into exhaust case boss at approximately 6:30 o'clock position. See Figure 1011.

(a) Align boltholes and install thermocouple housing into exhaust case boss. Install one bolt (1011/5), threads lubricated with Silver Goop P06−023, at lower front (scalloped) bolthole location. Handtighten bolt.

(b) Align boltholes and install thermocouple into thermocouple housing. Position bracket (1011/3) over thermocouple and install two bolts (1011/4), threads lubricated with Silver Goop P06−023. Handtighten bolts.

(c) Torque all bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(17) Install average pressure and temperature probe (1012/1) and thermocouple (1012/2) into exhaust case boss at approximately 4:30 o'clock position. See Figure 1012.

(a) Align boltholes and install probe (1012/1) into exhaust case boss. Install one bolt (1012/3), threads lubricated with Silver Goop P06-023, at upper front (scalloped) bolthole location. Handtighten bolt.

(b) Align boltholes and install thermocouple (1012/2) into probe (1012/1). Position bracket (1012/4) over thermocouple and install two bolts (1012/5), threads lubricated with Silver Goop P06-023. Handtighten bolts.

(c) Torque all bolts to 54 - 60 lb-in. (6.101 - 6.779 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(18) Install average pressure and temperature probe (1013/1) and thermocouple (1013/2) into exhaust case boss at approximately 10 o'clock position. See Figure 1013.

(a) Align boltholes and install probe (1013/1) into exhaust case boss. Install one bolt (1013/4), threads lubricated with Silver Goop P06-023, at lower front (scalloped) bolthole location. Handtighten bolt.

(b) Align boltholes and install thermocouple (1013/2) into probe (1013/1). Install two bolts (1013/3), threads lubricated with Silver Goop P06-023. Handtighten bolts.

NOTE: Bolts will be torqued after thermocouple cable installation.

(19) For engines with the one piece EEC PT4.95 manifold assembly (1014/1) (Pre SB PW4ENG 72-134) install the EEC PT4.95 manifold assembly as follows. See Figure 1014.

CAUTION: DO NOT USE ANY LUBRICANTS ON THE EEC PT4.95 MANIFOLDS, TUBES, OR ADAPTERS. CONTAMINATION OF THE EEC CAN RESULT.

(a) Remove the covers. Install the manifold (1014/1) to the probes at 4:30 and 10 o'clock positions. Tighten the manifold nuts (1014/7) by hand.

(b) Install the eight clamps (1014/2) that attach the manifold to the exhaust case brackets. Attach the bottom three clamps (1014/2) with three bolts (1014/4), lubricated with Engine Oil P03-001, and nuts (1014/3). Torque the clamp bolts (1014/4) to 36 - 40 lb-in. (4.067 - 4.519 N.m).

NOTE: Attach the remaining clamps (1014/2) with the installation of the (TT4.95) thermocouple box and cable assembly.

(c) Torque the manifold nuts (1014/7) to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(d) Install the washer (1014/6) and plug (1014/5) to the manifold. Torque the plug (1014/5) to 40 - 50 lb-in. (4.519 - 5.649 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug.

(20) For engines with the three piece EEC PT4.95 manifold (Post SB PW4ENG 72-134), install the two EEC PT4.95 manifold assemblies (1015/1 and 1015/2) and the EEC PT4.95 tube assembly (1015/3) as follows. See Figure 1015.

CAUTION: DO NOT USE ANY LUBRICANTS ON THE EEC PT4.95 MANIFOLDS, TUBES, OR ADAPTERS. CONTAMINATION OF THE EEC CAN RESULT.

(a) Remove the covers. Install the two manifolds (1015/1 and 1015/2) and the tube (1015/3) to the probe adapters and to each other. Tighten the tube and manifold nuts (1015/9) by hand.

(b) Install the eight clamps (1015/4) that attach the manifolds and tube to the exhaust case brackets. Attach the bottom three clamps (1015/4) with the two bolts (1015/6), lubricated with Engine Oil P03-001, and three nuts (1015/5). Torque the bolts (1015/6) and three nuts (1015/5) to 36 - 40 lb-in. (4.067 - 4.519 N.m).

NOTE: Attach the remaining clamps (1015/4) with the installation of the (TT4.95) thermocouple box and cable assembly.

(c) Torque the manifold nut and tube nut (1015/9) to the probe adapters to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(d) Torque the manifold nut (1015/11) at the 6 o'clock position to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(e) Torque the tube nut (1015/12) at the 8 o'clock position to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(f) Install the washer (1015/7) and plug (1015/8) to the manifold. Torque the plug (1015/8) to 40 - 50 lb-in. (4.519 - 5.649 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug..

(21) Install thermocouple box and cable assembly (EGT TT4.95) for engines without the revised TT4.95 cable and PT4.95 sensing manifold for increased engine core clearance (Pre SB PW4ENG 72-134). See Figure 1016 (Sheets 1 and 2) and Figure 1017.

CAUTION: USE OF LUBRICANTS ON PT4.95 EEC MANIFOLD ASSEMBLY TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(a) Remove nuts (1017/1) and (1017/2) and washers (1017/4) and (1017/3) from thermocouples (four locations) and attach TT4.95 harness leads to thermocouple and reinstall washers and nuts.

1 (Reference 2273) Torque alumel (larger) nuts to 18 - 22 lb-in. (2.034 - 2.486 N.m).

2 (Reference 2273) Torque chromel (smaller) nuts to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(b) For average pressure and temperature probe located at 10 o'clock position, remove work bolt (1017/7) at lower front (scalloped) bolthole location. Secure cable clamp with engine bolt, threads lubricated with Engine Oil P03−001. Tighten all three bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(c) Secure cable clamps to brackets and to clamps on adjacent PT4.95 manifold. Secure with bolts (1017/5) threads lubricated with Engine Oil P03−001, and nuts (1017/6). Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Position cables over support (1017/5) as shown in Figure 1017. Install rear end of support to bracket on Flange T. Secure support with two bolts (1017/7), threads lubricated with Engine Oil P03−001. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). Temporarily secure opposite end of support to Flange P with workbolts and nuts.

(e) Install bracket (inner front) (1017/4) and (inner rear) (1017/8) to support over cables as shown in referenced figure. Secure brackets with bolts (1017/6), threads lubricated with Engine Oil P03−001. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Install box and cable assembly cover (1017/3) to bracket (1017/1) on Flange P. Lubricate threads of bracket studs with Engine Oil P03−001, and secure junction box to bracket with nuts. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(22) Install thermocouple box and cable assembly (EGT TT4.95) for engines with the revised TT4.95 cable and PT4.95 sensing manifold for increased engine core clearance (Post SB PW4ENG 72−134). See Figure 1018.

(a) Install the box and cable assembly to the bracket on Flange P. Lubricate the threads on the bracket studs with Engine Oil P03−001, and attach the junction box to the bracket with nuts. Torque the nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m). See View J.

(b) Remove the nuts and lockwashers from the thermocouple terminal studs at the four thermocouple locations. Install the thermocouple cable leads to the thermocouple studs. Install the lockwashers and nuts (stepped washer face next to the lockwasher) handtight only. See Views A, C, E, and I.

(c) Attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position with a bolt, threads lubricated with Silver Goop P06−023. Torque the three bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts. See View E.

(d) Clamp the top two thermocouple leads at the 10 o'clock thermocouple to the bracket brazed on the EEC PT4.95 tube. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View E.

(e) Install the cable clamps to the brackets adjacent to the thermocouples. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views A and C.

(f) Install the cable clamps and the EEC PT4.95 tube/ manifold clamps to the brackets on Flange T at five locations. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views G and H.

(g) Install the cable clamps to the brackets on Flange T at five locations. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View B.

(h) Install the cable clamp to the bracket brazed on the EEC PT4.95 manifold at the 4:30 o'clock position. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View C.

(i) Clamp the bottom two thermocouple leads at the 4:30 o'clock thermocouple to the EEC PT4.95 manifold, 1/2 inch (12.700 mm) from the manifold nut. Attach the leads with two clamps, bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View C.

(j) Install the cable clamp to the bracket brazed on the EEC PT4.95 tube. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001 and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View F.

(k) Install the cable clamps, and a clamp on the bottom two thermocouple leads, to the bracket adjacent to the thermocouple at the 7 o'clock position. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, nuts and spacer. Install the spacer between the lead clamp and the cable clamp. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View I.

(l) Make a loop in the thermocouple cable adjacent to the 7 o'clock thermocouple. Attach the cable clamp, nearest to the loop, to the rear support bracket with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(m) Install the rear positioning plate with the rear spacer inside the cable/thermocouple lead loop and the front spacer inside the cable adjacent to the cable clamp. Attach the positioning plate to the rear support bracket with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(n) Make a loop in the thermocouple cable adjacent to the junction box. Attach the cable clamp, nearest to the loop, to the front support bracket with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(o) Install the front positioning plate on the two cables with the spacers, inboard, between the cables. Attach the plate to the front support bracket with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519). See View J.

NOTE: The cables installed below the positioning plate will be compressed by the plate when torquing the bolts.

(p) Install the positioning plate on the thermocouple cable at approximately the 5 o'clock position. Install the cable to the left of the inner spacer and to the right of the outer spacer on the plate. Attach the positioning plate and the clamp on the EEC PT4.95 manifold to the support bracket with two bolts, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View D.

NOTE: The cable installed below the positioning plate will be compressed by the plate when torquing the bolts.

(q) Install the cable clamp to the inboard side of the reinforcing plate at the 5:30 o'clock position. Attach the clamp to the plate with a bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View D.

(r) Align the thermocouple cable leads attached to the studs on the thermocouple so they are parallel to one another. Torque the nuts at each thermocouple as follows:

1 (Reference 2273) Torque the alumel nuts (larger studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

2 (Reference 2273) Torque the chromel nuts (smaller studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: After the nuts are torqued, make sure that the cable leads DO NOT CONTACT the adjacent bolt heads or lockwire.

Subtask 72−54−00−430−060:

(23) Use a Cherrymax rivet gun and head to install rivets PN 50P308 into the purge/drain holes at the 13 strut locations as shown in Figure 1019. See 70−43−00, Standard Practices Manual, PN 585005. If rivets were previously installed, it is permitted for some residual rivet material to remain inside the strut internal cavity.

Subtask 72−54−00−430−059:

(24) Remove turbine exhaust case from build stand.

  (a) Remove ball lock pin from left bracket flange.

  (b) Open clamp securing flange brackets to vertical supports of build stand.

  (c) Attach PWA 28657 Sling to hoist. Attach sling to outer spools of brackets on turbine exhaust case with PWA 76154 Adapters.

  (d) Lift and trunnion case to rear end down position and lower onto pallet. Remove hoist, sling, adapters and brackets from case.

TURBINE EXHAUST CASE - ASSEMBLY-01

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

MAIN GEARBOX - HOW TO USE

Task 72-61-00-990-003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant main gearbox parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED - This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED - This designation is applied to numbers in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

MAIN GEARBOX	72-61-00
DEOILER IMPELLER, GEARSHAFT, AND BEARINGS ASSEMBLY	72-61-01
GEARBOX DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-02
STARTER DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-03
FUEL PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-04
REAR HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-05
IDG DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-06
FRONT HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-07
SCAVENGE PUMP DRIVE GEARSHAFT AND BEARING ASSEMBLY	72-61-08

MAIN GEARBOX − HOW TO USE

MAIN GEARBOX − DESCRIPTION/OPERATION−00

Task 72−61−00−990−002:

1. General

See Figure 1 andFigure 2.

A. The main gearbox transmits power from the engine to the accessories mounted on the gearbox. It provides specific speeds, torques and mounting provisions required for the accessories to perform their various functions.

B. The main gearbox is located at the bottom of the HPC rear case and immediately in front of the diffuser case. See Figure 1. It is attached utilizing a three point system. Two points of this system are widely spaced, transverse−pin supported ball joints between the gearbox and the engine cases at K Flange. The third support point consists of a vertical link with a single ball joint attachment on the gearbox driveshaft housing and two ball joint attachments on the HPC rear case. The ball joint attachments are free to move upon their support pins to allow for engine diameter thermal growth without imposing loads on the gearbox mounting system.

C. The main gearbox consists of a cast aluminum housing incorporating a gear train and mounting pads for airframe and engine accessories. Drive pads on the rear face of the housing are furnished for the integrated drive generator system, for the starter, for the engine hydraulic pump and for the main oil/scavenge pump. The electronic engine control generator drive pad and the breather pad are also on the rear face See Figure 2. The front face of the housing has pads for mounting the fuel pump/fuel metering unit in tandem, and the front hydraulic pump. With the oil tank mounted directly into the gearbox housing from the rear , the main oil filter is installed on a pad on the front face.

D. The power to drive the accessories is obtained from the high pressure compressor. A towershaft in the intermediate case is geared to the front of the HPC shaft and drives through the bevel gears in the angle gearbox to the gearbox driveshaft and the main gearbox. General lubrication of the gears, bearings and gearshaft splines is accomplished by use of oil jets and oil splash.

MAIN GEARBOX − DESCRIPTION/OPERATION−00

E. All accessory drive components are plug−in units. The pad seals are spring loaded carbon which bear on a polished carburized surface. With the sole exception of the fuel pump, all accessory mount pads were designed with a pad cavity drain boss. The fuel pump/fuel metering unit combination has its cavity drain in the fuel pump housing.

F. Starter Drive

(1) The direction of rotation is counterclockwise. Starter drive coupling splines are not lubricated.

G. Integrated Drive Generator

(1) The direction of rotation is counterclockwise. The drive incorporates lubricated spline feature. The drive splines are lubricated by a stream of oil which is scooped into the center of the shaft, passes through the splines, and is discharged through seventeen radial holes in the shaft into the gearbox cavity.

H. Rear Hydraulic Pump Drive

(1) The direction of rotation is counterclockwise. The drive shaft has positive oil lubrication introduced to the center of the shaft at the opposite end of the shaft by an oil nozzle. After passing through the splines, the oil is discharged into the main gearbox cavity through twelve radial holes in the driveshaft.

I. Engine Fuel Pump/Fuel Metering Unit drive

(1) The direction of rotation is clockwise. The drive shaft has positive oil lubrication introduced to the center of the shaft at the opposite end of the shaft by an oil nozzle. After passing through the splines, the oil is discharged into the main gearbox cavity through twelve radial holes in the drive shaft.

J. Electronic Engine Control Generator Drive

(1) The direction of rotation is counterclockwise.

K. Engine Main Oil/Scavenge Pump Drive

(1) The direction of rotation is counterclockwise.

L. Main Gearbox Bearings

(1) In all main gearbox locations, the bearings are roller bearings. In locations where accessory drive shafts are supported, the outer races are flanged. Only the idler gear has the bearing inner race clamped. The flanged bearings have double shouldered inner races and single shouldered outer races. Lubrication and cooling is accomplished by mist oil.

M. Main Gearbox Seals

(1) The gearbox seal assemblies are spring loaded carbon face seals retained in an aluminum housing. The entire seal assembly is repairable/replaceable.

N. Gearbox Main Oil Pressure/Scavenge Pumps

(1) The main oil pressure pump and the five scavenge pumps are all assembled in one housing and that housing is mounted on the rear face of the main gearbox housing. The main oil pump is a single stage, positive displacement gear pump that delivers a variable oil flow proportional to the engine rotor speed/engine operating condition. Oil from the No. 1/1.5/2 bearing compartment, the No. 3 bearing compartment and the angle and main gearboxes is scavenged back to the oil tank through the designated scavenge pumps. Combined breather air/scavenge oil from the No. 4 bearing compartment is returned to the oil tank through the scavenge pump.

O. Engine De−Oiler

(1) The deoiler is mounted on the front face of the main gearbox housing just to the left of and below the engine oil tank. Breather air from the Nos. 1/1.5/2 and 3 bearing compartments is passed through the deoiler, the entrapped oil is removed from the air and returned to the oil tank and the breather air is vented overboard through the turbine exhaust case.

P. Engine Oil Filter

(1) The main oil filter housing is mounted on the front face of the main gearbox housing at the forward end of the engine oil tank. The filter installed in the housing is a 15 micron nominal disposable type filter. The housing has a bypass feature in the event of a plugged filter to allow for uninterrupted oil flow.

MAIN GEARBOX − DESCRIPTION/OPERATION−00

Q. Front Hydraulic Pump Drive

(1) The direction of rotation is counterclockwise. The drive shaft has positive oil lubrication introduced to the center of the shaft at the opposite end of the shaft by an oil nozzle. After passing through the splines, the oil is discharged into the main gearbox cavity through twelve radial holes in the driveshaft.

MAIN GEARBOX - DISASSEMBLY-01

Task 72-61-00-030-001:

1. Disassemble The Lube Oil Tank From The Main Gearbox

A. Equipment And Materials Required

Special Tools:

PWA 75599	Build Stand
PWA 85123	Fixture (Optional to PWA 86056 Fixture)
PWA 85241	Arm
PWA 85242	Adapter, Holding
PWA 85327	Adapter
PWA 86056	Fixture
PWA 88231	Puller, Jackscrew

B. Procedure

Subtask 72-61-00-030-051:

CAUTION: IF LUBE OIL TANK IS INSTALLED, GEARBOX ASSEMBLY MUST BE POSITIONED IN BUILD STAND WITH REAR FACE (OIL TANK SIDE) UP. SEE FIGURE 501. ASSEMBLY MUST NOT BE ROTATED IN BUILD STAND PRIOR TO OIL TANK REMOVAL. TANK WILL BE DAMAGED BY CONTACTING BUILD STAND BASE IF ASSEMBLY IS ROTATED.

(1) Install gearbox housing in PWA 75599 Build Stand. See Figure 501.

(a) Insert shaft of PWA 85327 Adapter through hole in rear post of stand.

(b) Align boltholes in post details of PWA 86056 Fixture or PWA 85123 Fixture with boltholes in four ground handling points of gearbox. Secure post details to gearbox using bolts (501/2)

(c) Attach PWA 85242 Adapter to gearbox mounting lugs and secure with two pins (501/1).

(d) Attach PWA 85241Arm to fixture and secure with four detail screws.

(e) Attach hoist to arm and trunnion gearbox to horizontal position.

MAIN GEARBOX − DISASSEMBLY−01

(f) Position gearbox between posts of stand. Align boltholes in PWA 85242 Adapter with boltholes in mounting pad of stand and secure with detail bolts.

(g) Remove screws securing arm to fixture. Remove arm.

(h) Slide PWA 85327 Adapter forward, aligning boltholes and secure PWA 85237 Adapter to fixture with four bolts (501/3).

Subtask 72−61−00−030−068:

(2) Remove lube oil tank. See Figure 502 and Figure 504.

CAUTION: TO PREVENT DAMAGE TO THE GEARBOX HOUSING, MAKE SURE ALL THE OIL TANK TO GEARBOX ATTACHMENT BOLTS ARE REMOVED BEFORE INSTALLING PWA 88231 PULLER.

(a) (Pre SB PW4ENG 79−74) Remove the six (6) bolts (502/9) and nuts (502/12) that attach the cover (502/10) to the flange of the hole at the top of the lube oil tank (502/3).

(b) (Post SB PW4ENG 79−74) Remove the six (6) bolts (502/9) and nuts (502/12) that attach the cover (502/10) and the oil tank heat shield bracket (502/13) to the flange of the hole at the top of the lube oil tank (502/4).

(c) Remove the ten bolts (502/1) that attach the oil tank heat shield (502/2), bracket (pre SB PW4ENG 79−48) (502/4), bracket (502/6), bracket (Post SB PW4ENG 72−491) (502/8), and lube oil tank (502/3) to oil tank flange on rear left side of gearbox housing. The bracket must stay with the gearbox. Use PWA 88231 Puller to carefully remove oil tank from gearbox. Discard packing (502/5) from oil tank front diameter.

(d) Loosen screw detail of oil tank clamp (502/7) and remove clamp and oil tank heat shield (502/2) from oil tank.

(e) Use PWA 88231 Puller to carefully remove oil tank from gearbox. Discard the packing (502/7) from the oil tank front diameter. See Figure 503.

(f) Remove two bolts (504/10) securing oil check valve housing (504/2) or (504/2A) to internal mounting flange in oil tank housing (504/6). Remove housing. Discard packing (504/1) and, if applicable, gasket. Remove oil check valve assembly (504/4). Discard packings (504/3) and (504/5).

(g) Remove two bolts (504/9) securing sealing sleeve (504/8) to center bore in internal mounting flange in oil tank housing. Remove sealing sleeve. Discard packing (504/7).

(h) Remove two bolts (504/12) securing transfer tube (504/13) to lower bore in internal mounting flange in oil tank housing. Remove transfer tube. Discard packings (504/11).

C. Postrequisites

(1) Remove the EEC alternator rotor and stator, the lubrication and scavenge oil pump, and the brackets from the main gearbox. Refer to Disassembly-06 (Task 72-61-00-030-006).

(2) Remove the magnetic chip detector assemblies from the lube oil tank, the lubrication and scavenge oil pump, and the main gearbox. Refer to Disassembly-07 (Task 72-61-00-030-007).

(3) Disassemble front hydraulic pump drive and IDG drive gearshaft from main gearbox per Disassembly-02 (Task 72-61-00-030-002).

(4) Disassemble main gearbox per Disassembly-03 (Task 72-61-00-030-003).

MAIN GEARBOX - DISASSEMBLY-02

Task 72-61-00-030-002:

1. Disassemble Front Hydraulic Pump Drive And IDG Drive Gearshaft From Main Gearbox

A. Prerequisites

(1) Remove the oil tank from the main gearbox. Refer to Disassembly-01 (Task 72-61-00-030-001).

(2) Remove the EEC alternator rotor and stator, the lubrication and scavenge oil pump, and the brackets from the main gearbox. Refer to Disassembly-06 (Task 72-61-00-030-006).

(3) Remove the magnetic chip detector assemblies from the lube oil tank, the lubrication and scavenge oil pump, and the main gearbox. Refer to Disassembly-07 (Task 72-61-00-030-007).

B. Equipment And Materials Necessary

Standard Tools:

0.250-28 Jackscrews (2 Necessary)

Special Tools:

PWA 85203	Puller

C. Procedure

Subtask 72-61-00-030-066:

(1) Remove front hydraulic pump drive cover, gearshaft and bearings assembly. See Figure 501 and Figure 502.

(a) For those engines not using a front hydraulic pump, remove nuts (501/1) securing front hydraulic pump drive cover to gearbox. Remove cover (501/2) and gasket (501/3). Remove nut (501/4) and washer (501/5). Remove plug (501/6). Discard packing (501/7). Remove bolt (501/9). Discard packing (501/8).

(b) Remove two bolts (502/3) securing nozzle (502/4) to boss on top of bearing housing (502/2). Remove nozzle. Discard packings (502/5) and (502/6).

(c) Remove four bolts (502/12) securing bearing support (502/1) to bearing housing (502/2). Remove bearing support and gearshaft assembly from housing. Discard packing (502/11).

(d) Remove eight bolts (502/10) and washers (502/9) securing housing (502/2) to front hydraulic pump drive pad (502/7). Remove bearing housing from gearbox using two 0.250−28 Jackscrews, if applicable.

(e) Discard packing (502/8) from rear flange of bearing housing.

Subtask 72−61−00−030−067:

(2) Remove IDG drive cover, gearshaft and bearings assembly. See Figure 503 and Figure 504.

(a) For those engines not using an IDG, remove bolts (503/1) and washers (503/2) securing IDG drive pad cover to gearbox. Remove cover (503/3) and gasket (503/4). Remove nut (503/5) and washer (503/6). Remove plug (503/7). Discard packing (503/8). Remove bolt (503/10). Discard packing (503/9).

(b) Remove lockwire and plug (504/10) from port on bottom of bearing housing (504/6). Discard packing (504/9). Remove bushing (504/11) from port. Discard packing (504/8).

(c) Remove retaining ring (504/1) securing face (oil) seal (504/2) to bore in bearing housing (504/6). Using PWA 85203 Puller, remove seal. Discard packing (504/3).

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(d) Remove twelve bolts (504/4) and washers (504/5) securing bearing housing (504/6) to IDG drive pad (504/12). Separate and remove bearing housing from gearbox using three 0.250−28 Jackscrews, if applicable. Discard packing (504/7).

NOTE: Roller bearing outer race is secured to inside of bearing housing assembly and will be removed from location on gearshaft as housing is withdrawn.

(e) Remove four bolts (504/14) securing bearing outer race (504/15) to boss on rear side of bearing housing. Remove outer race.

(f) Remove IDG drive gearshaft and bearings assembly (504/13) from gearbox.

(g) Place gearshaft and bearings assembly in suitable protective container.

D. Postrequisites

(1) Disassemble main gearbox per Disassembly−03 (Task 72−61−00−030−003).

MAIN GEARBOX − DISASSEMBLY−03

Task 72−61−00−030−003:

1. Disassemble Main Gearbox

A. Prerequisites

(1) Remove the oil tank from the main gearbox. Refer to Disassembly−01 (Task 72−61−00−030−001).

(2) Remove the EEC alternator rotor and stator, the lubrication and scavenge oil pump, and the brackets from the main gearbox. Refer to Disassembly−06 (Task 72−61−00−030−006).

(3) Remove the magnetic chip detector assemblies from the lube oil tank, the lubrication and scavenge oil pump, and the main gearbox. Refer to Disassembly−07 (Task 72−61−00−030−007).

(4) Disassemble front hydraulic pump drive and IDG drive gearshaft from main gearbox per Disassembly−02 (Task 72−61−00−030−002).

B. Equipment And Materials Necessary

Standard Tools:

0.250−28 Jackscrews (3 Required)
No. 10 Torq−Set Drive

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

Special Tools:

PWA 85204	Puller (Optional to PWA 88110)
PWA 85284	Drift
PWA 85285	Wrench (Optional to PWA 86149 Wrench)
PWA 85286	Base
PWA 85372	Wrench
PWA 85768	Knocker, Puller
PWA 86149	Wrench
PWA 88110	Puller
PWA 88736	Knocker, Puller
PWA 102799	Puller, Jackscrew

MAIN GEARBOX − DISASSEMBLY−03

Consumable Materials:

Item No.	Designation
P05−102	Dry Ice

C. Procedure

Subtask 72−61−00−030−052:

(1) Remove probe and drain plugs from drain ports in lower front face of gearbox housing. See Figure 501.

(a) Remove lockwire from plugs/probe (501/3), (501/7) and (501/11). Remove plugs/probe (501/3), (501/7) and (501/11). Discard packings (501/4), (501/8) and (501/12).

(b) Remove bushings (501/1), (501/5), (501/9) and (501/13) from drain ports. Discard packings (501/2), (501/6), (501/10) and (501/14).

Subtask 72−61−00−030−062:

(2) Remove starter drive gearshaft and bearings assembly. See Figure 502.

(a) Remove lockwire and plug (502/14) from port on bottom of bearing housing (502/3). Discard packing (502/13). Remove bushing (502/12) from port. Discard packing (502/11).

(b) Remove retaining ring (502/17) securing face (oil) seal (502/16) to bore in bearing housing (502/3). Using PWA 88110 Puller or PWA 85204 Puller, remove seal from housing. Discard packing (502/15).

(c) Remove eight bolts (502/1) and washers (502/2) securing bearing housing (502/3) to starter drive pad (502/7). Separate and remove bearing housing using three 0.250−28 Jackscrews, if applicable. Remove packing (502/4) from bearing housing and discard packing.

NOTE: Roller bearing outer race is secured to inside of bearing housing and will be removed from location on gearshaft as housing is withdrawn.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(d) Remove four bolts (502/5) securing bearing outer race (502/10) to boss on rear side of bearing housing. Remove outer race.

(e) Remove starter drive gearshaft and bearings assembly (502/9) from gearbox.

(f) Remove four bolts (502/6) securing bearing outer race (502/8) to boss on inside front wall of gearbox directly behind starter drive pad (502/7).

(g) Place gearshaft and bearings assembly in suitable protective container.

Subtask 72−61−00−030−053:

(3) Remove gearbox (fuel pump drive) spur gearshaft assembly. See Figure 503.

(a) Remove retaining ring (503/18) securing face (oil) seal (503/17) to bearing housing (503/1). Using PWA 88110 Puller or PWA 85204 Puller, remove seal from bearing housing. Discard packing (503/16).

(b) Remove one screw (503/19) securing bearing housing (503/1) to fuel pump drive pad (503/15) on left side of front face of gearbox housing. Separate and remove bearing housing using three 0.250−28 Jackscrews, if applicable. Invert the housing and place on workbench. Discard packing (503/2).

NOTE: Bearing outer race is secured to inside of bearing housing assembly and will be removed from location on gearshaft as bearing housing is withdrawn.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. BEARING INNER RACE AND ROLLERS ARE INSTALLED ON GEARSHAFT. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(c) Remove four bolts (503/4) securing bearing outer race (front) (503/3) to bearing housing. Remove outer race.

(d) Remove fuel pump drive gearshaft and bearings assembly (503/6) from gearbox and place on bench.

(e) Remove bolts (503/5) securing bearing outer race (rear) (503/7) to fuel pump drive pad on inside rear wall of gearbox. Remove outer race.

(f) Place gearshaft and bearings assembly in protective container.

(g) Remove lockwire and nozzle (503/13) installed in bushing (503/10) on rear side of gearbox. Discard packings (503/11) and (503/12).

(h) Using PWA 85372 Wrench, remove nut (503/8) on inside rear wall of gearbox that secures bushing (503/10) in nozzle bore (503/14). Remove bushing from gearbox. Discard packing (503/9) and nut (503/8).

Subtask 72−61−00−030−054:

(4) Remove gearbox nozzles and gearbox drive gearshaft and bearings assembly. See Figure 504 and Figure 505.

(a) Loosen the coupling nut detail and disconnect driveshaft pressure tube (504/6) from nozzle (EEC alternator) (504/5).

(b) Remove seven bolts (505/7) and washers (505/6) securing gearbox driveshaft housing (505/8) to gearbox drive pad (505/2). Separate and remove driveshaft housing using three 0.250−28 Jackscrews, if applicable.

(c) Place housing on workbench.

(d) Loosen coupling nut and disconnect driveshaft pressure tube (504/6) from driveshaft nozzle (504/7). Remove pressure tube.

(e) Remove bolt (504/10) securing driveshaft nozzle (504/7) to boss on upper rear of gearbox driveshaft housing (504/9). Remove nozzle. Discard packing (504/8).

(f) Remove bolt (504/1) securing nozzle (EEC alternator) (504/5) to pad on gearbox above gearbox driveshaft housing. Remove nozzle. Discard packings (504/2) and (504/3).

(g) Invert housing (505/8). Discard packing (505/5).

NOTE: Roller bearing outer race is secured to inside of driveshaft housing assembly and will be removed from location on gearshaft as gearbox driveshaft housing (505/8) is withdrawn.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(h) Remove gearbox drive gearshaft and bearings assembly (505/1) from gearbox.

(i) Remove four bolts (505/3) securing bearing outer race (505/4) to rear flange of driveshaft housing. Remove outer race.

(j) Place gearshaft and bearings assembly in suitable protective container.

Subtask 72−61−00−030−056:

(5) (Pre SB PW4ENG 72−114) Remove scavenge pump drive idler gearshaft and bearings assembly. See Figure 506.

(a) Remove two bolts (506/10) and washers (506/9) securing cover (manual crank) (506/8) to (scavenge pump drive) bearing housing (506/11). Remove cover using PWA 85768 Puller Knocker. Discard packing (506/7).

(b) Remove five bolts (506/13) and five washers (506/14) securing gearbox bearing housing (506/11) to scavenge pump drive pad (506/3). Carefully separate and remove bearing housing, invert and place on workbench. Discard packing (506/15).

NOTE: Roller bearing outer race is secured to inside of bearing housing assembly and will be removed from location on gearshaft as housing is withdrawn.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(c) With a No. 10 Torq−Set Drive, remove two bolts (506/16) that attach the bearing outer race (506/12) to the boss on the rear side of the bearing housing. Remove the outer race.

(d) Carefully separate and remove scavenge pump drive idler gearshaft and bearings assembly (506/4) from gearbox.

NOTE: Roller bearing outer race is secured to inside of gearbox housing assembly and will remain in gearbox as gearshaft and bearings (506/4) assembly is withdrawn.

(e) Remove two screws (506/17), located under idler gear, securing bearing outer race (506/18) to rear wall of gearbox housing. Remove bearing outer race.

(f) Place gearshaft and bearings assembly in protective container.

Subtask 72−61−00−030−057:

(6) (Pre SB PW4ENG 72−114) Remove scavenge pump drive gearshaft and bearings assembly. See Figure 506.

(a) Using holes in gear as required, remove two screws (506/6) securing bearing detail of scavenge pump drive gearshaft and bearing assembly (506/5) with a No. 10 Torq−Set Drive. Remove gearshaft and bearing assembly from scavenge pump drive gearshaft bore (506/2).

(b) Place gearshaft and bearing assembly in suitable labeled container.

Subtask 72−61−00−030−076:

(7) (Post SB PW4ENG 72−114) Remove scavenge pump drive gearshaft and bearing assembly together with scavenge pump drive idler gearshaft and bearings assembly. See Figure 507.

(a) Remove two bolts (507/23) and washers (507/22) securing cover (manual crank) (507/21) to (scavenge pump drive) bearing housing (507/19) assembly. With PWA 85768 Knocker, remove cover. Discard packing (507/20).

(b) Remove five bolts (507/10) and five washers (507/9) securing bearing housing assembly (507/19) to scavenge pump drive pad (507/14). Carefully separate and remove bearing housing, invert and place on workbench. Discard packing (507/8).

NOTE: Roller bearing outer race is secured to inside of bearing housing assembly and will be removed from location on gearshaft as housing is withdrawn.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(c) With a No. 10 Torq−Set Drive, remove two screws (507/6) that attach the guide (507/7) and the bearing outer race (507/18) to boss on rear side of bearing housing. Remove the guide and the outer race.

(d) Using PWA 85372 Wrench, enter gearbox from rear. Remove nut (507/11) on scavenge pump drive gearshaft (507/16). Discard the nut (507/11).

(e) If applicable, remove sleeve (507/12).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. FOLLOWING REMOVAL, KEEP ALL DETAILS TOGETHER IN A CONTAINER.

(f) Remove ring (507/13).

NOTE: The ring is a detail of the bearing.

(g) With a No. 10 Torq−Set Drive, remove two screws (507/17) securing drive gear bearing outer race (507/15).

(h) Entering gearbox through scavenge pump drive pad (507/14), carefully pull up on both the scavenge pump drive idler gearshaft and bearing assembly (507/5) and the scavenge pump drive gearshaft and bearing assembly (507/16) at the same time.

NOTE: The idler gearshaft bearing outer race will stay in the gearbox. The drive gearshaft bearing assembly will stay with the gearshaft.

(i) Carefully remove both gearshaft and bearing assemblies.

(j) Remove the bearing outer race and rollers (507/15) from the drive gearshaft (507/16).

(k) With a No. 10 Torq−Set Drive, remove two screws (507/4) securing idler gear bearing outer race (507/3) to rear wall of gearbox housing.

Subtask 72−61−00−030−077:

(8) (Post SB PW4ENG 72−463) Remove scavenge pump drive idler gearshaft and bearings assembly. See Figure 508.

(a) Remove two bolts (508/12) and washers (508/11) securing cover (manual crank) (508/10) to (scavenge pump drive) bearing housing (508/8). Remove cover using PWA 85768 Puller Knocker. Discard packing (508/9).

MAIN GEARBOX − DISASSEMBLY−03

(b) Remove five bolts (508/13) and five washers (508/14) securing gearbox bearing housing (508/8) to scavenge pump drive pad (508/3). Carefully separate and remove bearing housing, invert and place on workbench. Discard packing (508/15).

NOTE: Roller bearing outer race is secured to inside of bearing housing assembly and will be removed from location on gearshaft as housing is withdrawn.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(c) With a No. 10 Torq−Set Drive, remove two screws (508/6) that attach the bearing outer race (508/7) to the boss on the rear side of the bearing housing. Remove the outer race.

(d) Carefully separate and remove scavenge pump drive idler gearshaft and bearings assembly (508/16) from gearbox.

NOTE: Roller bearing outer race is secured to inside of gearbox housing assembly and will remain in gearbox as gearshaft and bearings (508/16) assembly is withdrawn.

(e) Remove two screws (508/17) located under idler gear, securing bearing outer race (508/18) to rear wall of gearbox housing. Remove bearing outer race.

(f) Place gearshaft and bearings assembly in protective container.

Subtask 72−61−00−030−078:

(9) (Post SB PW4ENG 72−463) Remove scavenge pump drive gearshaft and bearings assembly. See Figure 508.

(a) Using holes in gear as required, remove two screws (508/5) securing bearing detail of scavenge pump drive gearshaft and bearing assembly (508/4) with a No. 10 Torq−Set Drive. Remove gearshaft and bearing assembly from scavenge pump drive gearshaft bore (508/2).

(b) Place gearshaft and bearing assembly in suitable labeled container.

Subtask 72−61−00−030−058:

(10) Remove deoiler gearshaft and bearings assembly. See Figure 509.

(a) Remove 11 bolts (509/13) and washers (509/12) securing deoiler housing (509/11) to deoiler pad (509/6). With PWA 102799 Jackscrew Puller, remove housing, and discard packing (509/10).

(b) Carefully separate and remove deoiler gearshaft and bearings assembly (509/9) from gearbox. Remove packing (509/8) from bearing housing (509/4). Discard packing.

NOTE: Roller bearing outer race (509/7) is secured to inside of gearbox housing assembly and will remain in gearbox as gearshaft and bearings assembly (509/9) is withdrawn.

(c) (Engines With The Alternate Lubrication Configuration) Remove the bolt (515/27), nut (515/30) and clamp (515/28) that attaches the oil supply tube to the bracket (515/29). See Figure 515 (Sheet 2).

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. INNER RACE AND ROLLERS OF THIS BEARING ARE INSTALLED ON DEOILER GEARSHAFT. MAKE CERTAIN THAT ALL DETAILS OF BEARING ARE KEPT TOGETHER IN CONTAINER FOLLOWING REMOVAL.

(d) (Engines With The Alternate Lubrication Configuration) Remove the four bolts (509/5) that attach the bearing outer race (509/7) and the flange end of the oil supply tube (515/26) to inside rear wall of the gearbox behind the deoiler pad (509/6).

(e) (Engines With The Alternate Lubrication Configuration) Remove the oil supply tube from the gearbox and discard the packing (515/25). Remove the outer race.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. INNER RACE AND ROLLERS OF THIS BEARING ARE INSTALLED ON DEOILER GEARSHAFT. MAKE CERTAIN THAT ALL DETAILS OF BEARING ARE KEPT TOGETHER IN CONTAINER FOLLOWING REMOVAL.

(f) (Engines Without The Alternate Lubrication Configuration) Remove the four bolts (509/5) that attach the bearing outer race (509/7) to the inside rear wall of gearbox behind the deoiler pad (509/6). Remove the outer race.

(g) Place the gearshaft and bearings assembly in a suitable protective container.

(h) Remove the retaining ring (509/1) securing the face (oil) seal (509/2) to bore in rear of gearbox behind deoiler pad. Using PWA 88110 Puller or PWA 85204 Puller, remove seal from gearbox. Discard the packing (509/3).

Subtask 72−61−00−030−059:

(11) Remove main oil filter and pressure relief valve assembly. See Figure 510.

(a) Remove four bolts (510/9) and washers (510/8) securing main oil filter and pressure relief valve assembly (510/7) to main oil filter pad (510/5). Remove assembly from gearbox.

(b) For engines that are (Pre SB PW4ENG 79−43) Remove two transfer tubes (510/2) and one transfer tube (510/4) from oil filter housing. Remove packings (510/1) and (510/3) from transfer tubes. Discard packings.

(c) For engines that are (Post SB PW4ENG 79−43) Remove two transfer tubes (510/4) and (510/6) and the antisiphon tube assembly (510/2A). Discard the packings (510/1) and (510/3).

Subtask 72−61−00−030−060−001:

(12) (Pre SB PW4ENG 72−491) Remove the gearbox idler spur gear. See Figure 511 (Sheet 1).

MAIN GEARBOX − DISASSEMBLY−03

(a) Remove two bolts (511/1) securing idler shaft (511/2) to idler shaft bore (511/10). Withdraw idler shaft from gearbox sufficiently to install spacer detail of PWA 86149 Wrench under flange of gearshaft. Secure gearshaft and spacer to gearbox with detail bolts.

(b) Using PWA 86149 Wrench, remove nut (511/9) securing spur gear (idler) and bearing assembly to idler shaft (511/2) between spur gear and inside front wall of gearbox housing. Discard the nut (511/9).

(c) Remove detail bolts securing idler shaft and spacer to gearbox. Withdraw idler shaft sufficiently to remove spur gear and bearing assembly (511/6, 511/7, and 511/8) from gearshaft. Remove idler shaft (511/2) from gearbox housing. Remove bearing ring (511/4) from idler shaft. Discard packing (511/3).

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(d) Remove retaining ring (511/5) from spur gear (511/7).

(e) Remove bearing inner race (511/8).

(f) Install spur gear and bearing assembly (511/6) and (511/7), retaining ring groove end down, onto PWA 85286 Base. Using PWA 85284 Drift and arbor press, separate bearing outer race and rollers (511/6) from spur gear. Remove bearing outer race.

(g) Place bearing details (511/4, 511/6, and 511/8) in suitable protective container.

Subtask 72−61−00−030−060−002:

(13) (Post SB PW4ENG 72−491) Remove gearbox idler spur gear. See Figure 511 (Sheet 2).

(a) Remove two bolts (511/25) that hold the boss assembly (511/21) to the gearbox.

MAIN GEARBOX − DISASSEMBLY−03

(b) Remove lock plate (511/24) and boss assembly (511/21) from the gearbox. Discard packing (511/3).

(c) Remove oil supply adapter assembly (511/23) from the boss assembly (511/21). Discard packing (511/22).

(d) Remove gearbox idler shaft and gear assembly through the idler shaft bore (511/10) in the rear of the gearbox.

(e) Hold the gearbox idler shaft (511/20) in a vise. Tighten on the flats of the shaft.

(f) Use PWA 86149 Wrench to remove the bearing retaining nut (511/9) from the gearbox idler shaft (511/20). Discard the nut (511/9).

(g) Remove spur gear and bearing assembly from the idler shaft (511/20).

(h) Remove the bearing retaining ring (511/5) from the spur gear (511/7).

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(i) Install spur gear and bearing assembly, retaining ring groove end down, into PWA 85286 Base. Use PWA 85284 Drift and an arbor press to remove the bearing (511/26) from the spur gear (511/7).

(j) Place bearing in a protective container.

Subtask 72−61−00−030−060−003:

(14) (Post SB PW4ENG 72−664) Remove gearbox idler spur gear. See Figure 511 (Sheet 3).

(a) Remove two bolts (511/25) that hold the boss assembly (511/21) to the gearbox.

(b) Remove lock plate (511/24) and boss assembly (511/21) from the gearbox. Discard packing (511/3).

(c) Remove oil supply adapter assembly (511/23) from the boss assembly (511/21). Discard packing (511/22).

(d) Remove gearbox idler shaft and gear assembly through the idler shaft bore (511/10) in the rear of the gearbox.

(e) Hold the gearbox idler shaft (511/20) in a vise. Tighten on the flats of the shaft.

(f) Use PWA 86149 Wrench to remove the bearing retaining nut (511/9) from the gearbox idler shaft (511/20). Discard the nut (511/9).

(g) Remove spur gear and bearing assembly from the idler shaft (511/20).

(h) Remove the bearing retaining ring (511/5) from the spur gear (511/38).

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(i) Install spur gear and bearing assembly, retaining ring groove end down, into PWA 85286 Base. Use PWA 85284 Drift and an arbor press to remove the bearing (511/36) and pin (511/37) from the spur gear (511/38).

(j) Place bearing in a protective container.

Subtask 72−61−00−030−061:

(15) Remove EEC alternator drive gearshaft and bearings assembly. See Figure 512.

(a) For engines that are (Pre SB PW4ENG 75−59) Remove the three bolts (512/1), washers (512/2), and bracket (512/6), securing the EEC alternator drive gearshaft and bearings assembly (512/3) to the EEC alternator drive pad (512/4). Remove the assembly from the gearbox and discard the packing (512/5).

(b) For engines that are (Post SB PW4ENG 75−59) Remove the three bolts (512/1) and manifold (512/7) (Pre SB PW4ENG 72−375) securing the EEC alternator drive gearshaft and bearing assembly (512/3) to the EEC alternator drive pad (512/4). Remove the assembly from the gearbox and discard the packing (512/5).

Subtask 72−61−00−030−063:

(16) Remove rear hydraulic pump drive cover, gearshaft and bearings assembly. See Figure 513 and Figure 514.

(a) For those engines not using a rear hydraulic pump, remove nuts (513/1) securing rear hydraulic pump drive pad cover to gearbox. Remove cover (513/2) and gasket (513/3). Remove nut (513/4) and washer (513/5). Remove plug (513/6). Discard packing (513/7). Remove bolt (513/9). Discard packing (513/8).

(b) Remove lockwire and plug (514/18) from port on bottom of bearing housing (514/15). Discard packing (514/19). Remove bushing (514/17) from port. Discard packing (514/16).

(c) Remove retaining ring (514/23) securing face (oil) seal (514/22) to bore in bearing housing (514/15) using PWA 88110 Puller or PWA 85204 Puller, remove seal (514/22) from housing. Discard packing (514/21).

(d) Remove two screws (514/20) securing bearing housing (514/15) to rear hydraulic pump drive pad (514/1). Separate and remove bearing housing using three 0.250−28 Jackscrews, if applicable. Discard packing (514/14).

NOTE: Roller bearing outer race is secured to inside of bearing housing and will be removed from location on gearshaft as housing is withdrawn.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(e) Remove four bolts (514/9) securing bearing outer race (514/13) to boss on rear side of bearing housing. Remove outer race.

(f) Remove rear hydraulic pump drive gearshaft and bearings assembly (514/12) from gearbox.

(g) Remove four bolts (514/10) securing bearing outer race (514/11) to boss on inside front wall of gearbox directly behind rear hydraulic pump drive pad (514/1). Remove outer race.

(h) Place gearshaft and bearings assembly in protective container.

(i) Remove lockwire and nozzle (514/2) installed in bushing (514/5) on left front face of gearbox. Discard packings (514/3) and (514/4).

(j) Using PWA 85372 Wrench, remove nut (514/8) that secures bushing (514/5) in nozzle port (514/7) from inside front wall of gearbox. Remove bushing. Remove packing (514/6). Discard the nut (514/8).

Subtask 72−61−00−030−064:

(17) Remove the gearbox pressure manifold (Non−Alternate Lubrication Configuration). See Figure 515 (Sheet 1).

(a) Remove nut (515/1) and washer (515/2) securing bushing (515/3) to stud detail of gearbox pressure manifold (515/13) located above front hydraulic pump drive boss (515/5). Discard packing (515/4).

(b) Remove bolt (515/10), nut (515/12) and clamp (515/9) securing manifold to bracket (515/11).

(c) Remove bolt (515/8) securing manifold, bracket (515/11) and bearing outer race to inside front wall of gearbox.

MAIN GEARBOX − DISASSEMBLY−03

(d) Remove bolt (515/14) securing curved support detail of manifold and bearing outer race to inside rear wall of gearbox.

(e) Remove manifold from gearbox. Discard packing (515/7) and gasket (515/6).

(18) Remove the gearbox pressure manifold (Alternate Lubrication Configuration). See Figure 515 (Sheet 2).

(a) Remove the nut (515/1) and washer (515/2) that attach the bushing (515/3) to the stud detail of the gearbox pressure manifold (515/24) located above the front hydraulic pump drive boss (515/5). Discard packing (515/4).

(b) Remove the bolt (515/10), nut (515/12) and clamp (515/9) that attaches the manifold to the bracket (515/11).

(c) Remove the bolt (515/8) that attaches the manifold, bracket (515/11) and bearing outer race to the inside front wall of the gearbox.

(d) Remove the bolt (515/14) that attaches the curved support detail of the manifold and bearing outer race to the inside rear wall of the gearbox.

(e) Remove the manifold from the gearbox. Discard the packing (515/7) and gasket (515/6).

Subtask 72−61−00−030−065:

(19) Remove bearing outer races and gearbox strainer element. See Figure 516.

(a) Remove three remaining bolts (516/1) securing bearing outer race (516/2) to boss on inner rear wall of gearbox directly behind gearbox drive bore (516/3).

(b) Remove three remaining bolts (516/10) securing bracket (516/9) and bearing outer race (516/8) to boss on inner front wall of gearbox directly behind IDG bore (516/7). Remove outer race and bracket.

(20) Remove gearbox strainer element. See Figure 517.

(a) Remove two bolts (517/2) securing gearbox strainer element (517/3) to inside bottom (sump) of gearbox housing (517/1).

(b) Remove strainer element from gearbox.

(21) Remove the gearbox from PWA 85242 Adapter. Support the gearbox with slings and a hoist. Remove the gearbox from PWA 86056 Fixture or PWA 85123 Fixture, PWA 85327 Adapter and PWA 75599 Build Stand. Put it on a pallet.

CAUTION: DO NOT USE PRY BARS OR SCREW DRIVER TYPE TOOLS TO REMOVE THE GEARBOX LUG FROM THE MAIN GEARBOX. YOU CAN DAMAGE THE GEARBOX HOUSING SO THAT IT CAN NOT BE REPAIRED.

(22) (Pre SB PW4ENG 72−538) Remove the gearbox lug. See Figure 518.

(a) Remove the four (4) bolts that attach the gearbox lug to the main gearbox.

(b) Position a heat gun into the main gearbox housing and heat the surface below the gearbox lug.

(c) Put Dry Ice P05−102 over the gearbox lug.

(d) Heat the gearbox housing and cool the gearbox lug, at the same time, for fifteen (15) minutes.

(e) Remove the heat gun and dry ice.

(f) With brass drifts and hammers, hammer the drifts in a up direction against the gearbox lug post.

(g) First hit one side of the gearbox lug post, then hit the other side to force the gearbox lug out of the gearbox housing.

NOTE: Two (2) persons are necessary to do this procedure and it must be done fast.

(h) If the gearbox lug does not move, do steps (b) through (g) again, as necessary.

(23) (Post SB PW4ENG 72−538) Remove the gearbox lug. See Figure 518.

MAIN GEARBOX - DISASSEMBLY-03

(a) Remove the four (4) bolts that attach the gearbox lug to the main gearbox.

(b) Use PWA 88736 Puller to remove the gearbox lug from the gearbox lug from the main gearbox.

D. Postrequisites

(1) Disassemble main oil filter, housing and pressure relief valves assembly per Disassembly-04 Task 72-61-00-030-004.

(2) Disassemble lube oil tank, deaerator and baffle assembly per Disassembly-05 Task 72-61-00-030-005.

(3) Disassemble deoiler gearshaft and bearings assembly per 72-61-01, Disassembly-01 Task 72-61-01-040-001.

(4) Disassemble gearbox drive gearshaft and bearings assembly per 72-61-02, Disassembly-01 Task 72-61-02-040-001.

(5) Disassemble starter drive gearshaft and bearings assembly per 72-61-03, Disassembly-01 Task 72-61-03-040-001.

(6) Disassemble fuel pump drive gearshaft and bearings assembly per 72-61-04, Disassembly-01 Task 72-61-04-040-001.

(7) Disassemble rear hydraulic pump drive gearshaft and bearings assembly per 72-61-05, Disassembly-01 Task 72-61-05-040-001.

(8) Disassemble scavenge pump drive gearshaft and bearing assembly per 72-61-08, Disassembly-01 Task 72-61-08-040-001-001.

(9) Disassemble EEC alternator drive gearshaft and bearings assembly per 72-61-09, Disassembly-01 Task 72-61-09-040-001.

(10) Disassemble scavenge pump drive idler gearshaft and bearings assembly per 72-61-40, Disassembly-01 Task 72-61-40-040-001.

(11) Disassemble the front hydraulic pump drive gearshaft and bearings assembly. Refer to 72-61-07, Disassembly-01 Task 72-61-07-040-001.

1. Disassemble Main Oil Filter, Housing And Pressure Relief Valves Assembly

   A. Equipment And Materials Required - None

   B. Procedure

   See Figures 501 and 502.

Subtask 72-61-00-030-071:

(1) (Pre PW4ENG 72-524) Position main oil filter housing (501/3), large mounting flange side down, on bench. See Figure 501 (Sheet 1).

(a) Remove lockwire and pressure relief valve (filter element) (501/19) from port in main oil filter housing (501/3) located just above pressure (regulator) relief valve pad (501/16). Discard packings (501/17) and (501/18).

(b) Remove inserts (501/1) from ports in face of main oil filter housing. Discard packings (501/2).

(c) Remove lockwire, plug (501/12), and insert (501/10) from bottom port in main oil strainer cover (501/15). Discard packings (501/9) and (501/11).

(d) Remove four bolts (501/13) and washers (501/14) securing main oil strainer cover (501/15) to main oil filter housing (501/3). Remove cover and filter element (501/4) from housing. Remove filter element. Discard packing (501/8).

(e) Remove spring (501/5) from cover. Remove screw (501/6) securing key washer (501/7) to cover. Remove key washer and discard.

(2) (Post SB PW4ENG 72-524 and Pre SB PW4ENG 79-79) Position main oil filter housing (501/3), large mounting flange side down, on bench. See Figure 501 (Sheet 2).

(a) Remove lockwire and pressure relief valve (filter element) (501/19) from port in main oil filter housing (501/3) located just above pressure (regulator) relief valve pad (501/16). Discard packings (501/17) and (501/18).

MAIN GEARBOX − DISASSEMBLY−04

(b) Remove inserts (501/1) from ports in face of main oil filter housing. Discard packings (501/2).

(c) Remove lockwire, plug (501/12), and insert (501/10) from bottom port in main oil strainer cover (501/15). Discard packings (501/9) and (501/11).

(d) Remove lockwire, if necessary, the four nuts (501/29) or (501/30) and the washers (501/14) that secure the main oil strainer cover (501/15) to main oil filter housing (501/3). Remove cover and filter element (501/4) from housing. Remove filter element. Discard packing (501/8). Discard the four self−locking nuts (501/29) and keep the nuts (501/30) with the wire holes.

(e) Remove spring (501/5) from cover. Remove screw (501/6) securing key washer (501/7) to cover. Remove key washer and discard.

(3) (Post SB PW4ENG 72−524 and SB PW4ENG 79−79) Position main oil filter housing (501/3), large mounting flange side down, on the work bench. See Figure 501 (Sheet 3).

(a) Remove the lockwire and the pressure relief valve (filter element) (501/19) from the port in the main oil filter housing (501/3) located just above the pressure (regulator) relief valve pad (501/16). Discard the packings (501/17) and (501/18).

(b) Remove the inserts (501/1) from the ports in the face of the main oil filter housing. Discard the packings (501/2).

(c) Remove the lockwire, plug (501/12), and insert (501/10) from the bottom port in the main oil strainer cover (501/21). Discard the packings (501/9) and (501/11).

(d) Remove the lockwire, and if necessary, the four nuts (501/29) or (501/30) and the washers (501/14) that secure the main oil strainer cover (501/21) to the main oil filter housing (501/3). Remove the cover and the filter element (501/4) from the housing. Remove the filter element. Discard the packing (501/8). Discard the four self−locking nuts (501/29) and keep the nuts (501/30) with the wire holes.

MAIN GEARBOX − DISASSEMBLY−04

(e) Remove the spring (501/5) from the cover (501/21). Remove the two screws (501/22) and the two washers (501/20) securing the spring retainer (501/23) to the cover (501/21).

(4) (Post SB PW4ENG 72−525) Position main oil filter housing (501/3), large mounting flange side down, on bench. See Figure 501 (Sheet 4).

(a) Remove lockwire and plug (501/43) from port in main oil filter housing (501/3) located just above pressure (regulator) relief valve pad (501/16). Discard packings (501/17) and (501/18).

(b) Remove inserts (501/1) from ports in face of main oil filter housing. Discard packings (501/2).

(c) Remove lockwire and plug (501/12), from bottom port in main oil strainer cover (501/42). Discard packing (501/11).

(d) Remove four nuts (501/29) and washers (501/14) securing main oil strainer cover (501/42) to main oil filter housing (501/3). Remove cover and filter element (501/39) from housing. Remove filter element. Discard packing (501/8). Discard the four self−locking nuts (501/29).

(e) Remove retaining ring (501/40) from pressure relief valve (501/41) and remove pressure relief valve from cover (501/42).

CAUTION: PRESSURE RELIEF VALVE IS SPRING LOADED. EXERCISE CARE WHEN REMOVING.

(5) Remove lockwire and carefully remove relief valve plug (502/1) from relief valve housing (502/8). Discard packing (502/2). See Figure 502.

(6) Remove spring (502/3) and pressure relief valve (502/4) from relief valve housing (502/8). Discard packing (502/5).

(7) Remove three bolts (502/6) securing relief valve housing and bracket (502/7) to pressure relief pad (502/12) on front face of main oil filter housing (502/11). Remove bracket and relief valve housing. Discard packings (502/9) and (502/10).

MAIN GEARBOX - DISASSEMBLY-05

Task 72-61-00-030-005:

1. Disassemble The Lube Oil Tank And Deaerator Assembly
   - A. Prerequisites
     - (1) Remove the oil tank sight gage. Refer to 72-00-61, Removal-31 (Task 72-00-61-050-013).
   - B. Equipment And Materials Required - None
   - C. Procedure

Subtask 72-61-00-030-072:

- (1) Remove the deaerator assembly as follows. See Figure 501.
  - (a) Remove the bolts (501/6) that attach the oil tank baffle (501/5) to the flange of the lube oil tank (called oil tank) (501/2). Remove the baffle.
  - (b) Remove the bolts (501/4) and washers (501/3) that attach the deaerator (501/1) to the oil tank (501/2).
- (2) Remove the oil tank breather tube assembly (502/6), (Pre SB PW4ENG 79-34 and Post SB PW4ENG 79-81). See Figure 502.
  - (a) Remove the two bolts that attach the breather tube to the oil tank deaerator (502/4). Remove the tube.
  - (b) Discard two packings (502/5).
- (3) Remove the oil tank breather tube assembly (502/7), (Post SB PW4ENG 79-34 and Pre SB PW4ENG 79-81).
  - (a) Remove the bolts that attach the clamps to the bracket.
  - (b) Remove the bolts that attach the bracket and tube to the deaerator (502/4).
  - (c) Remove the breather tube assembly (502/7).
  - (d) Discard the packing (502/5) at each end of the tube.
- (4) Remove the two bolts (502/1) that attach the sealing sleeve (502/2) to the oil tank deaerator (502/4). Remove the sealing sleeve. Discard the packing (502/3).
- (5) If it is necessary to use the oil tank cap and related parts from this oil tank on another oil tank, remove the oil tank cap and related parts. This procedure is for an oil tank with either no remote filler or post SB PW4ENG 79-47. See Figure 503.
  - (a) Remove the oil tank cap (503/1):
    - 1 Lift the handle. Turn the cap counterclockwise. Remove the cap.
    - 2 Remove the lockwire and bolt (503/4) that hold the oil tank cap lanyard (503/3).
    - 3 Discard the packing (503/2).
  - (b) Remove the filler neck valve (503/5):
    - 1 Remove the lockwire and remaining bolts (503/4).

Removal Of The Oil Tank Cap And Related Parts
(No Remote Filler Or Post SB PW4ENG 79-47)
Figure 503
(Task 72-61-00-030-005)

MAIN GEARBOX − DISASSEMBLY−05

        2 Remove the filler neck valve.
        3 Discard the packing (503/6).
        4 Examine the packing (503/8) under the valve. If the packing is cut or deteriorated, discard it.
    (c) Remove the oil tank sump (503/7).

(6) If it is necessary to use the oil tank cap and related parts from this oil tank on another oil tank, remove the oil tank cap and related parts. This procedure is for an oil tank with a remote filler, pre SB PW4ENG 79−47. See Figure 504.
    (a) Remove the oil tank cap (504/1):
        1 Lift the handle. Turn the cap counterclockwise. Remove the cap.
        2 Remove the bolt (504/4) and nut (504/1) that hold the oil tank cap lanyard (504/5).
        3 Discard the packing (504/2).
    (b) Remove the filler neck valve (504/3):
        1 Remove the lockwire and the remaining bolts (504/4 and 504/7) and nuts (504/16).
        2 Remove the filler neck valve.
        3 Discard the packing (504/6).
        4 Examine the packing (504/17) under the valve. If the packing is cut or deteriorated, discard it.
    (c) Remove the oil tank sump (504/8).
    (d) Remove the connector (504/9) (remote filler):
        1 Remove the lockwire and bolts (504/12).
        2 Remove the connector.
        3 Discard the packing (504/13).
        4 If applicable, remove the plugs (504/11 and 504/15) and packings (504/10 and 504/14). Discard the packings.

(7) To protect the oil tank, install covers on the holes.

MAIN GEARBOX - DISASSEMBLY-06

Task 72-61-00-030-006:

1. Disassemble The EEC Alternator, Lubrication And Scavenge Oil Pump, And The Brackets From The Main Gearbox

A. Prerequisites

(1) Remove the lube oil tank from the main gearbox. Refer to Disassembly-01 Task 72-61-00-030-001.

B. Equipment And Materials Required

Special Tools:

PWA 85238	Wrench (Optional to PWA 86603)
PWA 85931	Puller
PWA 85749	Adapter, Torque
PWA 86551	Puller
PWA 86603	Adapter, Holding
PWA 88774	Jackscrew (2 Necessary)

C. Procedure

Subtask 72-61-00-030-069:

(1) Remove lubrication and scavenge oil pump. See Figure 501.

(a) Loosen and remove bolts (501/8) and washers (501/7) that attach the lubrication and scavenge oil pump (501/9) to lubrication and scavenge pump pad (501/5) on rear face of gearbox. Use two (2) PWA 88774 Jackscrews to break the pump away from the gearbox. Disengage tubes from oil pump and remove pump from gearbox. Remove the two transfer tubes (501/1) and (501/3) and discard packings (501/2) and (501/4). Discard packings on oil pump (501/6).

(b) Install protective closures on pump.

Subtask 72-61-00-030-070:

(2) Remove EEC alternator rotor and stator (Pre SB PW4ENG 72-375). See Figure 502, Figure 503 and Figure 504.

(a) Disconnect electrical connectors from EEC alternator stator cables at bracket on lower left side of gearbox.

(b) Remove bolts (502/4) and (502/5) and plate (502/4) securing EEC stator cables to bracket.

(c) Remove clamp and bolt (502/1) securing cable to bracket below alternator. Remove cables from spring clips (502/2) and (502/3) on rear face of gearbox.

(d) Remove the three bolts (503/1) and if equipped, washer (503/3) and heat shield (503/2) securing the EEC alternator stator (503/4) to the pad on the upper center, rear face, of the gearbox. Remove the stator and discard packing (503/5).

(e) Remove nut (503/6) securing EEC alternator rotor (503/8) to gearshaft (503/9) with PWA 85238 Wrench or PWA 86603 Adapter. Discard the nut (503/6).

1 Loosen both jamnuts (504/4) and retract wrench detail (504/5) from body of adapter. Insert handle (504/3), lug end facing outward, over mating lug of wrench detail (504/5).

2 Align boltholes and position body (504/2) over EEC gearshaft and onto gearshaft housing (504/1) pad. Engage lugs of wrench detail with mating slots in gearshaft. Secure body (504/2) with three detail screws (504/6).

3 Seat wrench detail (504/5) firmly on gearshaft and secure with jamnuts (504/4).

4 Engage lugs of handle (504/6) with mating lugs in nut (504/7). Rotate handle to loosen nut.

(f) Remove EEC alternator rotor lock (503/7) and rotor (503/8) from gearshaft.

1 To remove the rotor (503/8), use PWA 85931 Puller.

(3) Remove the EEC alternator rotor and stator (Post SB PW4ENG 72−375). See Figure 505, Figure 506, Figure 507 and Figure 508.

(a) Using PWA 85749 Torque Adapter, disconnect the harness from the EEC alternator stator cables at a bracket on the lower left side of gearbox.

MAIN GEARBOX - DISASSEMBLY-06

(b) Remove the bolts (505/3), (505/4) and plate (505/5) that attach EEC stator cables to bracket. Remove the plate (505/5) and both cable connectors from bracket.

(c) Remove the cables from spring clips (505/1) and (505/2) from brackets on the rear face of gearbox.

(d) Remove the nut (506/4) that attaches the EEC alternator rotor (506/5) to the gearshaft (506/6) with PWA 86603 Adapter as follows. Discard the nut (506/4).

1 Loosen both jamnuts (507/4). While you hold the body (507/2), loosen the wrench detail (507/5).

2 Install the handle (507/3), lug end facing outward, over the mating lug of wrench detail (507/5).

3 Align boltholes and postion body (507/2) over EEC gearshaft (506/6) and onto the gearshaft housing pad.

4 Engage lugs of wrench detail with mating slots in gearshaft. Attach the body (507/2) with three detail screws (507/6).

5 Seat the wrench detail (507/5) firmly on the gearshaft and tighten the jamnuts (507/4).

6 Engage the lugs of handle (507/3) with the mating lugs in the nuts (507/7). Turn the handle to loosen the nut using a standard 1/2 inch drive.

NOTE: This must be done in several steps as the handle movement is limited. The handle must be removed and postioned again to the nut.

7 Remove the screws (507/6) that attach the wrench to the gearbox and remove wrench.

(e) Remove the nut (507/7) that attaches EEC alternator rotor to the gearshaft.

(f) Remove the rotor (508/5) from the gearshaft (508/6) with PWA 86551 Puller as follows.

1 Retract the hex bolt (508/2) on the rotor puller. Loosen the two socket head screws (508/3) and install the jaws (508/1) in the puller groove on the rotor (508/5).

2 Install the ring (508/4) around the jaws (508/1) and against the shoulder of the jaws.

3 Tighten the two socket head screws (508/3).

4 Tighten the hex head bolt (508/2) until the rotor is removed from the gearshaft (508/6).

NOTE: The puller and rotor can turn when the hex bolt (508/2) is tightened. To prevent the rotor from turning, you can install a rod or punch into one of the holes in the puller jaws and hold while the hex bolt is tightened.

5 Loosen the hex bolt (508/2) and the two socket head screws (508/3). Remove the ring (508/4) from the puller and remove the puller from the rotor.

6 Remove the rotor (508/5) from the gearshaft (508/6).

Subtask 72−61−00−030−073:

(4) Remove brackets. See Figure 509.

(a) Remove the following brackets and bolts from front face of gearbox.

Bracket	Bolt (Quantity)	Nut (Quantity)
2	1 (3)	
3	4 (2)	
6	5 (2)	7 (2)
8	9 (2)	
17 or	16 (2)	
17A	16 (2)	
19	18 (2)	20 (2)

MAIN GEARBOX − DISASSEMBLY−06

(b) Remove the following brackets and bolts from rear face of gearbox.

Bracket	Bolt (Quantity)	Nut (Quantity)
11 or	10 (2)	
11A	10 (2)	
13	12 (1)	
14	15 (3)	
20	22 (2)	21 (2)

D. Postrequisites

(1) Remove the magnetic chip detector assemblies from the lube oil tank, the lubrication and scavenge oil pump, and the main gearbox. Refer to Disassembly−07 (Task 72−61−00−030−007).

(2) Disassemble front hydraulic pump drive and IDG drive gearshaft from main gearbox per Disassembly−02 (Task 72−61−00−030−002).

(3) Disassemble main gearbox per Disassembly−03 (Task 72−61−00−030−003).

Bracket Removal
Figure 509
(Task 72−61−00−030−006)

MAIN GEARBOX - DISASSEMBLY-07

Task 72-61-00-030-007:

1. Remove The Magnetic Chip Detector Assemblies From The Main Gearbox

   A. General

      (1) To remove the full magnetic plug assembly, first remove the plug, then remove the valve.

   B. Equipment And Materials Necessary - None

   C. Procedure

      CAUTION: INSTALL PROTECTIVE COVERS OVER ALL OPENINGS AS SOON AS POSSIBLE TO PREVENT ENGINE DAMAGE.

      CAUTION: DO NOT TRY TO REMOVE THE MAGNETIC CHIP DETECTOR AS AN ASSEMBLY. THE MAGNETIC CHIP DETECTOR PROBE MUST BE REMOVED FROM THE VALVE TO PREVENT DAMAGE TO THE PART.

      (1) Remove the magnetic chip detectors from the engine oil tank. See Figure 501.

         (a) Remove the PN 50R499 magnetic chip detector from the engine oil tank as follows:

            1 Remove the lockwire or safety cable from the valve (501/4).

            2 Push the magnetic probe (501/5) in and turn it counterclockwise to disengage it from the valve.

            3 Remove the probe from the valve.

            4 Remove the packing (501/3) from the probe. Discard the packing.

            5 Remove the valve from the engine oil tank.

            6 Install the magnetic probe into the valve.

            7 Remove the packing (501/2) from the small OD end of the valve. Discard the packing.

            8 Remove the packing (501/1) from the washer face of the valve. Discard the packing.

MAIN GEARBOX − DISASSEMBLY−07

9 Remove the probe from the valve again.

(b) Remove the PN 50R485 magnetic chip detector from the engine oil tank as follows:

1 Remove the lockwire or safety cable from the valve (501/7).

2 Push the magnetic probe (501/9) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (501/8) from the probe. Discard the packing.

5 Remove the valve from the engine oil tank.

6 Install the magnetic probe into the valve.

7 Remove the packing (501/6) from the small OD end of the valve. Discard the packing.

8 Remove the packing (501/1) from the washer face of the valve. Discard the packing.

9 Remove the probe from the valve again.

(c) Remove the PN 50R423 (option) magnetic chip detector from the engine oil tank as follows:

1 Remove the lockwire or safety cable from the valve (501/10) or (501/13).

2 Push the magnetic probe (501/12) or (501/16) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (501/11) or (501/15) from the magnetic probe. Discard the packing.

5 Remove the valve from the engine oil tank.

6 If applicable, remove the packing (501/14) from the ID of the valve. Discard the packing.

7 Remove the packing (501/1) from the washer face of the valve. Discard the packing.

(d) Remove the PN 50R374 magnetic chip detector from the engine oil tank as follows:

1 Remove the lockwire or safety cable from the valve (501/17).

2 Push the magnetic probe (501/19) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (501/18) from the magnetic probe. Discard the packing.

5 Remove the valve from the engine oil tank.

6 Remove the packing (501/1) from the washer face of the valve. Discard the packing.

CAUTION: INSTALL PROTECTIVE COVERS OVER ALL OPENINGS AS SOON AS POSSIBLE TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO REMOVE THE MAGNETIC CHIP DETECTOR AS AN ASSEMBLY. THE MAGNETIC CHIP DETECTOR PROBE MUST BE REMOVED FROM THE VALVE TO PREVENT DAMAGE TO THE PART.

(2) Remove the magnetic chip detectors from the lubrication and scavenge oil pump. See Figure 502.

(a) Remove the PN 50R342 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (502/2).

2 Push the magnetic probe (502/4) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (502/3) from the probe. Discard the packing.

5 Remove the valve from the lubrication and scavenge oil pump.

6 Remove the packing (502/1) from the washer face of the valve. Discard the packing.

7 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(b) Remove the PN 50R348 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (502/8).

2 Push the magnetic probe (502/5) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (502/6) from the probe. Discard the packing.

5 Remove the valve from the lubrication and scavenge oil pump.

6 Remove the packing (502/7) from the ID of the valve. Discard the packing.

7 Remove the packing (502/1) from the washer face of the valve. Discard the packing.

8 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(c) Remove the PN 50R492 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (502/10).

2 Push the magnetic probe (502/12) in and turn it counterclockwise to disengage it from the valves.

3 Remove the probe from the valve.

MAIN GEARBOX - DISASSEMBLY-07

4 Remove the packing (502/11) from the probe. Discard the packing.

5 Remove the valve from the lubrication and scavenge oil pump.

6 Install the magnetic probe (502/12) into the valve (502/10).

7 Remove the packing (502/9) from the small OD end of the valve. Discard the packings.

8 Remove the packing (502/1) from the washer face of the valve. Discard the packing.

9 Remove the magnetic probe from the valve again.

10 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(d) Remove the PN 50R491 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (502/16).

2 Push the magnetic probe (502/13) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (502/14) from the probe. Discard the packing.

5 Remove the valve from the lubrication and scavenge oil pump.

6 Remove the packing (502/15) from the ID of the valve. Discard the packing.

7 Remove the packing (502/1) from the washer face of the valve. Discard the packing.

8 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(e) Remove the PN 50R501 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (502/18).

2 Push the magnetic probe (502/20) in and turn it counterclockwise to disengage it from the valves.

3 Remove the probe from the valve.

4 Remove the packing (502/19) from the probe. Discard the packing.

5 Remove the valve from the lubrication and scavenge oil pump.

6 Install the magnetic probe (502/20) into the valve (502/18).

7 Remove the packing (502/17) from the small OD end of the valve. Discard the packings.

8 Remove the packing (502/1) from the washer face of the valve. Discard the packing.

9 Remove the magnetic probe from the valve again.

10 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

CAUTION: INSTALL PROTECTIVE COVERS OVER ALL OPENINGS AS SOON AS POSSIBLE TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO REMOVE THE MAGNETIC CHIP DETECTOR AS AN ASSEMBLY. THE MAGNETIC PROBE MUST BE REMOVED FROM THE VALVE TO PREVENT DAMAGE TO THE PART.

(3) Remove the magnetic chip detector from the center front side of the main gearebox assembly. See Figure 503.

(a) Remove the PN 50R341 magnetic chip detector from the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (503/2).

MAIN GEARBOX − DISASSEMBLY−07

2 Push the magnetic probe (503/4) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (503/3) from the probe. Discard the packing.

5 Remove the valve from the main gearbox assembly.

6 Remove the packing (503/1) from the washer face of the valve. Discard the packing.

(b) Remove the PN 50R347 magnetic chip detector from the main gearbox assembly:

1 Remove the lockwire or safety cable from the valve (503/5).

2 Push the magnetic probe (503/8) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (503/7) from the probe. Discard the packing.

5 Remove the valve from the main gearbox assembly.

a Hold the bushing with a wrench so it does not turn.

b Remove the valve from the bushing.

6 Remove the packing (503/6) from the ID of the valve. Discard the packing.

7 Remove the packing (503/1) from the washer face of the valve. Discard the packing.

(c) Remove the PN 50R485 magnetic chip detector from the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (503/10).

2 Push the magnetic probe (503/12) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (503/11) from the probe. Discard the packing.

5 Remove the valve from the main gearbox assembly as follows:

   a Hold the bushing with a wrench so it does not turn.

   b Remove the valve from the bushing.

6 Install the magnetic probe into the valve.

7 Remove the packing (503/9) from the small OD end of the valve. Discard the packing.

8 Remove the packing (503/1) from the washer face of the valve. Discard the packing.

9 Remove the probe from the valve again.

(d) Remove the PN 50R484 magnetic chip detector from the center front side of the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (503/13).

2 Push the magnetic probe (503/16) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (503/15) from the probe. Discard the packing.

5 Remove the valve from the main gearbox as follows:

   a Hold the bushing with a wrench so it does not turn.

b Remove the valve from the bushing.

6 Remove the packing (503/14) from the ID of the valve. Discard the packing.

7 Remove the packing (503/1) from the washer face of the valve. Discard the packing.

(e) Remove the PN 50R499 magnetic chip detector from the center front side of the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (503/18).

2 Push the magnetic probe (503/20) in and turn it counterclockwise to disengage it from the valve.

3 Remove the probe from the valve.

4 Remove the packing (503/19) from the probe. Discard the packing.

5 Remove the valve from the main gearbox assembly as follows:

a Hold the bushing with a wrench so it does not turn.

b Remove the valve from the bushing.

6 Install the magnetic probe into the valve.

7 Remove the packing (503/17) from the small OD end of the valve. Discard the packing.

8 Remove the packing (503/1) from the washer face of the valve. Discard the packing.

9 Remove the probe from the valve again.

D. Postrequisites

(1) Disassemble the front hydraulic pump drive and IDG drive gearshaft from the main gearbox. Refer to Disassembly-02 (Task 72-61-00-030-002).

MAIN GEARBOX - DISASSEMBLY-07

(2) Disassemble the main gearbox per Disassembly-03 (Task 72-61-00-030-003).

MAIN GEARBOX − INSPECTION/CHECK−01

Task 72−61−00−990−004:

1. General Inspection Requirements − Main Gearbox

   A. Organization Of Individual Part Or Subassembly Inspection Data

      (1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check−00 for part/subassembly. Section designations and function descriptions are as follows.

      (2) Inspection/Check−00 section contains, where applicable:

         (a) Part number(s) for which the inspection data is applicable.

         (b) Service Bulletin numbers applicable to part number(s).

         (c) Inspection/Check numbers, data categories and applicability data.

      (3) Inspection/Check−01, Preinspection Preparation, contains, where applicable:

         (a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

         (b) Identification of mechanical disassembly required prior to inspection.

         (c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

         (d) Identification of part/subassembly cleaning required prior to inspection.

      (4) Inspection/Check−02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

         (a) Fluorescent Penetrant Method

         (b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/ subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−61−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−61−99 is limited to cleaning, non−destructive inspection, and the following:

  (1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

  (2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

MAIN GEARBOX − INSPECTION/CHECK−01

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer,tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

(1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

(2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

MAIN GEARBOX − INSPECTION/CHECK−03

Task 72−61−00−990−005:

1. Visual Inspection − Main Gearbox
   - A. For inspection requirements applicable to installed (accessible) parts of Main Gearbox, see 72−00−61, Inspection/Check−05 (Task 72−00−61−200−001).

MAIN GEARBOX - INSPECTION/CHECK-04

Task 72-61-00-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

MAIN GEARBOX − INSPECTION/CHECK−04

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

MAIN GEARBOX − ASSEMBLY−01

Task 72−61−00−400−001:

1. Assemble Main Gearbox

A. Prerequisites

(1) See 72−61−00, Inspection/Check−04 Task 72−61−00−990−001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble main oil filter, housing and pressure relief valves assembly per 72−61−00, Assembly−04 Task 72−61−00−400−004.

(3) Assemble lube oil tank, deaerator and baffle assembly per 72−61−00, Assembly−05 Task 72−61−00−400−005.

(4) Assemble deoiler gearshaft and bearings assembly per 72−61−01, Assembly−01 Task 72−61−01−440−001.

(5) Assemble gearbox drive gearshaft and bearings assembly per 72−61−02, Assembly−01 Task 72−61−02−440−001.

(6) Assemble starter drive gearshaft and bearings assembly per 72−61−03, Assembly−01 Task 72−61−03−440−001.

(7) Assemble fuel pump drive gearshaft and bearings assembly per 72−61−04, Assembly−01 Task 72−61−04−440−001.

(8) Assemble rear hydraulic pump drive gearshaft and bearings assembly per 72−61−05, Assembly−01 Task 72−61−05−440−001.

(9) Assemble scavenge pump drive gearshaft and bearing assembly per 72−61−08, Assembly−01 Task 72−61−08−440−001−001 or 72−61−08, Assembly−01 Task 72−61−08−440−001−002.

(10) Assemble EEC alternator drive gearshaft and bearings assembly per 72−61−09, Assembly−01 Task 72−61−09−440−001.

(11) Assemble scavenge pump drive idler gearshaft and bearings assembly per 72−61−40, Assembly−01 Task 72−61−40−440−001.

MAIN GEARBOX - ASSEMBLY-01

(12) Assemble the front hydraulic pump drive gearshaft and bearings assembly. Refer to 72-61-07, Assembly-01 Task 72-61-07-440-001.

B. Equipment And Materials Required

Standard Tools:

No. 10 Torq-Set Drive

Special Tools:

PWA 75599	Build Stand
PWA 80130	Gage, Force
PWA 85123	Fixture (Optional to PWA 86056 Fixture)
PWA 85241	Arm
PWA 85242	Adapter
PWA 85285	Wrench (Optional to PWA 86149 Wrench)
PWA 85327	Adapter
PWA 85338	Drift
PWA 85339	Base
PWA 85372	Wrench
PWA 86056	Fixture
PWA 86149	Wrench

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire
P06-007	Jelly, Petroleum
P06-054	Paste, Anti-Seize (PWA 36246)

Expendable Parts:

Lockwire, AS3214-02		

C. Procedure

Subtask 72-61-00-430-051:

(1) Install gearbox housing in build stand. See Figure 1001.

(a) Attach the gearbox lug to the gearbox with four bolts. Torque the bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m).

(b) Insert shaft of PWA 85327 Adapter through hole in rear post of stand.

(c) Align boltholes in post details of PWA 86056 Fixture or PWA 85123 Fixture with boltholes in four ground handling points of gearbox. Secure post details to gearbox using bolts (1001/2).

(d) Attach PWA 85242 Adapter to gearbox mounting lugs and secure with two pins (1001/1).

(e) Attach PWA 85241 Arm to fixture and secure with four detail screws.

(f) Attach hoist to arm and trunnion gearbox to horizontal position.

(g) Position gearbox between posts of stand. Align boltholes in PWA 85242 Adapter with boltholes in mounting pad of stand and secure with detail bolts.

(h) Remove screws securing arm to fixture. Remove arm.

(i) Slide PWA 85327 Adapter forward and align bolt holes and secure PWA 85237 Adapter to fixture with four bolts (1001/3).

Subtask 72−61−00−430−052:

(2) Insert gearbox strainer element (1002/3) through suitable opening in gearbox housing (1002/1) and position in sump in bottom center of housing. Align boltholes and secure strainer with two bolts (1002/2) lubricated with Engine Oil P03−001. Torque bolts to 27 − 30 lb−in. (3.051 − 3.390 N.m). See Figure 1002.

(3) (Engines Without The Alternate Lubrication Configuration) Install the gearbox pressure manifold assembly. See Figure 1003 (Sheet 1) and Figure 1004 (Sheet 1).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(a) Obtain mating bearing outer race (1003/2) from spur gear end of gearbox drive gearshaft and bearings assembly (1003/5). Align boltholes and position outer race inside gearbox housing to pad at rear of gearbox drive bore (1003/3). Secure outer race using three new bolts (1003/1) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Do not install bolt in hole at lower right bolt hole location (1003/4). Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(b) Obtain mating bearing outer race (1003/8) from small spur gear end of IDG drive gearshaft and bearings assembly (1003/11). Align boltholes and position outer race inside gearbox housing to pad at rear of IDG drive bore (1003/7). Position bracket (1003/9) to boltholes on right side of bearing outer race. Secure outer race using three new bolts (1003/10) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Do not install bolt in hole at upper right bolt hole location (1003/6). Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(c) Install gasket (1004/6) over threaded stud detail of gearbox pressure manifold (1004/13).

(d) Lubricate packings (1004/4) and (1004/7) with Engine Oil P03−001.

(e) Install packing (1004/7) to groove in stud detail of pressure manifold. Install packing (1004/4) to groove in bushing (1004/3).

(f) Position manifold inside gearbox. Insert stud detail of manifold through bore in boss on front side of gearbox directly over front hydraulic pump drive bore (1004/5). Install bushing (1004/3), with packing installed, over pressure manifold stud detail and into bore in front side of gearbox housing. Install washer (1004/2) and nut (1004/1), lubricated with Engine Oil P03−001, onto stud detail of manifold. Do not torque nut.

(g) Install a new bolt (1004/8) or bolt which has the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034), through lug detail of manifold and the bracket (1004/11) installed before and bearing outer race. Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Do not torque bolt.

(h) Secure manifold to bracket (1004/11) using clamp (1004/9), bolt (1004/10), lubricated with Engine Oil P03-001, and nut (1004/12). Do not torque bolt.

(i) Align boltholes and secure curved bracket detail of manifold with boltholes in previously installed bearing outer race in rear of gearbox housing. Secure manifold and bearing outer race using a new bolt (1004/14) or bolt which has the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque bolt to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(j) Torque bolt (1004/10) securing clamp to bracket to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(k) Torque bolt (1004/8) securing manifold lug to gearbox housing to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(l) Torque nut (1004/1) securing bushing to stud detail of manifold to 85 - 95 lb-in. (9.6 - 10.7 N.m).

(4) (Engines With The Alternate Lubrication Configuration) Install the gearbox pressure manifold assembly. See Figure 1003 (Sheet 2) and Figure 1004 (Sheet 2).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(a) Obtain the mating bearing outer race (1003/2) from the spur gear end of the gearbox drive gearshaft and bearings assembly (1003/5). Align the boltholes and position the outer race inside the gearbox housing to the pad at the rear of gearbox drive bore (1003/3). Secure the outer race using three bolts (1003/1). Do not install a bolt in hole at lower right bolt hole location (1003/4). Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(b) Obtain the mating bearing outer race (1003/8) from the small spur gear end of the IDG drive gearshaft and bearings assembly (1003/11). Align the boltholes and position the outer race inside the gearbox housing to the pad at the rear of the IDG drive bore (1003/7). Position the bracket (1003/9) to the boltholes on the right side of the bearing outer race. Position the bracket (1003/12) to the boltholes on left side of the bearing outer race. Secure the outer race and brackets with three bolts (1003/10 and 1003/13). Do not install a bolt in hole at the upper right bolt hole location (1003/6). Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(c) Install the gasket (1004/6) over the threaded stud detail of the gearbox pressure manifold (1004/24).

(d) Lubricate the packings (1004/4) and (1004/7) with Engine Oil P03−001.

(e) Install the packing (1004/7) to the groove in the stud detail of the pressure manifold. Install the packing (1004/4) to the groove in the bushing (1004/3).

(f) Position the manifold inside the gearbox. Insert the stud detail of the manifold through the bore in the boss on the front side of the gearbox directly over the front hydraulic pump drive bore (1004/5). Install the bushing (1004/3), with the packing installed, over the pressure manifold stud detail and into the bore in the front side of the gearbox housing. Install the washer (1004/2) and nut (1004/1), lubricated with Engine Oil P03−001, onto the stud detail of the manifold. Do not torque the nut.

(g) Install the bolt (1004/8) through the lug detail of the manifold, the previously installed bracket (1004/11) and the bearing outer race. Do not torque the bolt.

(h) Secure the manifold to the bracket (1004/11) with the clamp (1004/9), bolt (1004/10), lubricated with Engine Oil P03-001, and nut (1004/12). Do not torque the bolt.

(i) Align the boltholes and attach the curved bracket detail of the manifold with the boltholes in the previously installed bearing outer race in the rear of gearbox housing. Secure the manifold and bearing outer race with the bolt (1004/14). Torque the bolt to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(j) Apply Engine Oil P03-001 to the packing (1004/25) and install the packing to the end of the oil supply tube (1004/26). Install the packing end of the supply tube to the port on the side of the manifold. Attach the tube to the bracket (1004/29) with the bolt (1004/27), threads lubricated with Engine Oil P03-001, clamp (1004/28) and nut (1004/30).

(k) Torque the bolt (1004/10) that attaches the clamp to the bracket to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(l) Torque the bolt (1004/8) that attaches the manifold lug to the gearbox housing to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(m) Torque the nut (1004/1) that attaches the bushing to the stud detail of the manifold to 85 - 95 lb-in. (9.6 - 10.7 N.m).

Subtask 72-61-00-430-053:

(5) Install fuel pump drive gearshaft and bearings assembly. See Figure 1005.

(a) Install packing (1005/9), lubricated with Engine Oil P03-001, into groove in gearbox nozzle bushing (1005/10). Insert bushing, with hex head toward rear side of gearbox, into gearbox nozzle bore (1005/14). Using PWA 85372 Wrench, install bushing with new nut (1005/8) lubricated with Engine Oil P03-001. Torque nut to 300 - 350 lb-in. (34 - 39 N.m).

(b) Install packings (1005/12) and (1005/11), lubricated with Engine Oil P03-001, into grooves in nozzle (1005/13). Insert nozzle, lubricated with Engine Oil P03-001, with hex head toward rear side of gearbox, into previously installed bushing (1005/10). Torque nozzle to 90 - 100 lb-in. (10.169 - 11.298 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(c) Align boltholes and position mating bearing outer race (1005/7) onto pad in rear wall of gearbox housing directly behind fuel pump drive pad (1005/15). Secure outer race using three new bolts (1005/5) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(d) Align boltholes and position mating bearing outer race (1005/3) onto pad in rear side of bearing housing (1005/1). Secure outer race using four new bolts (1005/4) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(e) Insert fuel pump drive gearshaft and bearings assembly (1005/6), smaller spur gear toward rear, through bore in fuel pump drive pad (1005/15). Mate roller bearing on gearshaft with previously installed bearing outer race.

(f) Install packing (1005/2), lubricated with Engine Oil P03-001, into groove in bearing housing (1005/1). Align boltholes in housing with boltholes in fuel pump drive pad (1005/15). Align bearing outer race in housing with mating bearing on gearshaft and seat housing on fuel pump drive pad. Install new screw (1005/19) or screw which has the antigalling compound replaced by

SPOP 139 (Task 70-41-03-380-034), into chamfered bolthole in outer flange of housing. Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque screw to 27 - 30 lb-in. (3.051 - 3.390 N.m).

(g) Install packing (1005/16), lubricated with Engine Oil P03-001, into OD groove in face (oil) seal (1005/17). Install seal, carbon seal towards gearshaft, into bore in gearbox bearing housing (1005/1). Secure seal in bearing housing using retaining ring (1005/18).

NOTE: Before installing carbon seal, work seal thoroughly in engine oil to ensure free movement of carbon element. Carbon seal ring must have free axial movement without detectable binding throughout its full travel in seal carrier after immersion in engine oil, just prior to installation in gearbox assembly.

Subtask 72-61-00-430-054:

(6) (Pre SB PW4ENG 72-114) Install scavenge pump drive gearshaft and bearing assembly. See Figure 1006.

(a) Insert scavenge pump drive gearshaft and bearing assembly (1006/5), gearshaft end first, through scavenge pump drive pad (1006/3) and into scavenge pump drive gearshaft bore (1006/2) in internal pad of gearbox. Secure bearing using two screws (1006/6) or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Use a No. 10 Torq-Set Drive, torque screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

Subtask 72-61-00-430-055:

CAUTION: USE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED.

(7) (Pre SB PW4ENG 72-114) Install scavenge pump drive idler gearshaft and bearings assembly. See Figure 1006.

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(a) Align boltholes and position bearing outer race (1006/18) into scavenge pump drive idler gearshaft bore (1006/1). Secure bearing outer race using two new screws (1006/17) or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Use a No. 10 Torq-Set Drive, torque screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(b) Attach the bearing outer race (1006/12) to the bearing housing assembly (1006/11) with two new bolts (1006/16) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque the bolts to 27 - 30 lb-in. (3.051 - 3.390 N.m).

(c) Insert scavenge pump drive idler gearshaft and bearings assembly (1006/4), with smaller spur gear end toward rear, through bore in scavenge pump drive pad (1006/3). Mate roller bearing on gearshaft with bearing outer race and mesh smaller spur gear with previously installed scavenge pump drive gearshaft.

CAUTION: CORRECT INSTALLATION OF THE (SCAVENGE PUMP DRIVE) BEARING HOUSING ASSEMBLY IS VERY IMPORTANT. INCORRECT INSTALLATION OF THE HOUSING ASSEMBLY CAN DAMAGE THE ROLLERS OF THE BEARING.

(d) Install the (scavenge pump drive) bearing housing assembly (1006/11).

1 Lubricate with Engine Oil P03-001 a new packing (1006/15).

2 Install the packing in the packing groove of the bearing housing assembly.

3 Fill each cage of the front roller bearing on the idler gearshaft (1006/4) with Petroleum Jelly P06−007. The rollers must touch the inner race.

4 Do these three steps together:

a Very carefully install the bearing housing assembly on the scavenge pump drive pad (1006/3).

b Point a light into the center hole of the bearing housing assembly.

c Look into the hole to make sure that the rollers are engaged in the outer race.

5 Attach the bearing housing assembly to the gearbox with five washers (1006/14) and five new bolts (1006/13) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(e) Install packing (1006/7), lubricated with Engine Oil P03−001, into groove in OD of cover (1006/8). Align boltholes and install cover into bore in center of bearing housing. Secure cover using two new bolts (1006/10) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

Subtask 72−61−00−430−075:

CAUTION: USE THE CORRECT PART NUMBERS.
INTERCHANGEABILITY IS AFFECTED.

(8) (Post SB PW4ENG 72−114) Install scavenge pump drive gearshaft and bearing assembly together with the scavenge pump drive idler gearshaft and bearings assembly. See Figure 1007.

(a) Carefully install the bearing outer race and rollers (1007/15) on the scavenge pump drive gearshaft (1007/16).

(b) Insert scavenge pump drive gearshaft and inner race assembly (1007/16), shaft end first, through scavenge pump drive pad (1007/14) and into scavenge pump drive gearshaft bore (1007/2) in internal pad of gearbox.

(c) Using a No. 10 Torq-Set Drive, secure the bearing outer race and rollers with two new screws (1007/17) or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque the screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(d) Align boltholes and position scavenge pump drive idler gearshaft bearing outer race (1007/3) into scavenge pump drive idler gearshaft bore (1007/1). Secure bearing outer race with two new screws (1007/4) or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Use a No. 10 Torq-Set Drive. Torque screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(e) Install the guide (1007/7). See Figure 1008 for installation.

1 Place the guide (1007/7), non-chamfered end first, on the flat face of the bearing outer race (1007/18).

2 Attach the guide and the bearing outer race (1007/18) to the bearing housing (1007/19).

a Apply Anti-Seize Paste P06-054 to the threads of two screws (1007/6). Remove the unwanted paste.

b Attach the guide and the outer race to the bearing housing with the two screws.

c Use a No. 10 Torq−Set Drive.

d Torque to 27 − 30 lb−in. (3.051 − 3.390 N.m).

(f) Insert scavenge pump drive idler gearshaft and bearings assembly (1007/5), with smaller spur gear end toward rear, through bore in scavenge pump drive pad (1007/14).

(g) Pull up on scavenge pump drive gearshaft (1007/16) so that inner race and rollers of idler gearshaft (1007/5) can clear the scavenge pump drive gearshaft. Mesh idler and oil pump drive gears. Seat idler and oil pump drive gearshafts. Mesh idler large gear with adjacent starter drive gear.

(h) Remove any raised material on sleeve (1007/12) with a file or fine stone. From rear of gearbox, install scavenge pump drive gearshaft bearing ring (1007/13) and sleeve (1007/12).

NOTE: The ring is a detail of the bearing inner race. See Figure 1009.

CAUTION: CORRECT INSTALLATION OF THE (SCAVENGE PUMP DRIVE) BEARING HOUSING ASSEMBLY IS VERY IMPORTANT. INCORRECT INSTALLATION OF THE HOUSING ASSEMBLY CAN DAMAGE THE ROLLERS OF THE BEARING.

(i) Install the gearbox (scavenge pump drive) bearing housing assembly (1007/19).

1 Lubricate with Engine Oil P03−001 a new packing (1007/8).

2 Install the packing in the packing groove of the bearing housing assembly.

3 Fill each cage of the front roller bearing on the idler gearshaft (1007/5) with Petroleum Jelly P06−007. The rollers must touch the inner race.

4 Do these three steps together:

a Very carefully install the bearing housing assembly on the scavenge pump drive pad (1007/14).

b Point a light into the center hole of the bearing housing assembly.

c Look into the hole to make sure that the rollers are engaged in the outer race.

d Attach the bearing housing assembly to the gearbox with five washers (1007/9) and five new bolts (1007/10) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(j) Insert new nut (1007/11) from rear of gearbox and install on scavenge pump drive gearshaft (1007/16), fingertight.

(k) Insert wrench through hole in bearing housing assembly (1007/19) and install over wrenching flats at outboard end of idler gear (1007/5).

(l) While applying counter−torque with the idler gear wrench, torque nut (1007/11) to 500 − 600 lb−in. (57 − 68 N.m), using PWA 85372 Wrench.

(m) Install packing (1007/20), lubricated with Engine Oil P03−001, into groove in OD of cover (1007/21). Align boltholes and install cover into bore in center of bearing housing. Secure cover using two new bolts (1007/23) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

Subtask 72−61−00−430−076:

CAUTION: USE THE CORRECT PART NUMBERS.
INTERCHANGEABILITY IS AFFECTED.

(9) (Post SB PW4ENG 72−463) Install the scavenge pump drive gearshaft and bearing assembly. See Figure 1010.

(a) Install the gearshaft and bearing assembly (1010/4), shaft end first, through the scavenge pump drive pad (1010/3) and into the scavenge pump drive gearshaft bore (1010/2).

(b) Attach the assembly to the surface in the gearbox with two new screws (1010/5)or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034), through the bearing outer race. Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Use a No. 10 Torq-set Drive, torque the screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

Subtask 72-61-00-430-077:

CAUTION: USE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED.

(10) (Post SB PW4ENG 72-463) Install the scavenge pump drive idler gearshaft and bearing assembly. See Figure 1010.

CAUTION: YOU MUST KEEP TOGETHER ALL THE DETAILS OF A BEARING. THE MATING NUMBERS ARE MARKED ON THE DETAIL PARTS OF THE BEARING.

(a) Attach the bearing outer race (1010/18) to the scavenge pump drive idler gearshaft bore (1010/1) with two new screws (1010/17) or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Use a No. 10 Torq-set Drive, torque the screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

(b) Attach the bearing outer race (1010/7) to the (scavenge pump drive) bearing housing assembly (1010/8) with two new screws (1010/6) or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Use a No. 10 Torq-set Drive, torque the screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

(c) Apply Engine Oil P03-001 to a packing (1010/15). Install the packing in the groove in the (scavenge pump drive) bearing housing assembly (1010/8).

(d) Install the scavenge pump drive idler gearshaft and bearing inner race assembly (1010/16), small gear first, in the bearing outer race (1010/18).

(e) Carefully install the bearing housing assembly (1010/8) over the scavenge pump drive idler gearshaft and bearing inner race assembly (1010/16).

(f) Attach the bearing housing assembly (1010/8) to the gearbox. Use five washers (1010/14) and five new bolts (1010/13) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(g) Apply Engine Oil P03−001 to a packing (1010/9). Install the packing in the groove in the cover (1010/10). Attach the cover to the bearing housing (1010/8). Use two washers (1010/11) and two new bolts (1010/12) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

Subtask 72−61−00−430−056:

(11) Install gearbox nozzles and gearbox drive gearshaft and bearings assembly. See Figure 1011 and Figure 1012.

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(a) Align boltholes and install bearing outer race (1011/4) into rear ID of gearbox driveshaft housing (1011/8). Secure outer race using four new bolts (1011/3) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(b) Insert gearbox drive gearshaft and bearings assembly (1011/1), large spur gear end toward rear, through bore in gearbox drive pad (1011/2). Mate roller bearing with previously installed bearing outer race in rear wall of gearbox.

(c) Install packing (1011/5) lubricated with Engine Oil P03-001, into groove in rear OD of gearbox drive shaft housing (1011/8).

(d) Install packing (1012/2) and (1012/3) lubricated with Engine Oil P03-001, into grooves in gearbox (EEC alternator) nozzle (1012/5). Install nozzle into port above and to left of gearbox drive pad (1012/4). Secure nozzle using a new bolt (1012/1) or bolt which has the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque bolt to 62 - 72 lb-in. (7.005 - 8.135 N.m). See Figure 1012.

(e) Install packing (1012/8) lubricated with Engine Oil P03-001, into groove in driveshaft nozzle (1012/7). Install nozzle into port in boss at upper rear of gearbox driveshaft housing (1012/9). Secure nozzle using bolt (1012/10) lubricated with Engine Oil P03-001. Torque bolt to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(f) Apply Anti-Seize Paste P06-054 to the two tube nut threads of gearbox driveshaft pressure tube (1012/6). Remove the unwanted paste.

(g) Connect gearbox driveshaft pressure tube (1012/6), lockwire lug toward front, to fitting on nozzle (1012/7).

(h) Mate roller bearing outer race in housing (1011/8) with rollers on gearbox drive gearshaft. Align pressure tube (1012/6) and boltholes and seat housing on gearbox drive pad (1011/2). Secure housing using seven new bolts (1011/7) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034), and washers (1011/6). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque bolts to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(i) Torque tube nuts of pressure tube (1012/6) to 270 − 300 lb−in. (30.506 − 33.895 N.m).

(j) Install protective cover into opening at front end of housing (1011/8).

Subtask 72−61−00−430−059−001:

(12) (Pre SB PW4ENG 72−491) Install gearbox (idler) spur gear. See Figure 1013.

(a) Position spur gear (1013/7), stepped ID end down, into recess in PWA 85339 Base.

(b) Position bearing (1013/6) over bearing bore in gear.

(c) Position PWA 85338 Drift over outer race, with larger ID of drift over piloting pin detail of base.

(d) Using PWA 80130 Force Gage and arbor press, apply load of 1500 lb. (680.39 kg) to seat bearing.

(e) Remove gage and drift. Remove gear from base.

(f) Install retaining ring (1013/5) in groove in gear ID to secure outer race.

(g) Install packing (1013/3), lubricated with Engine Oil P03−001, into groove in flanged end of gearbox idler shaft (1013/2).

(h) Install bearing ring (1013/4) on the idler shaft. Seat the ring against the shaft shoulder.

(i) Insert gearbox idler shaft (1013/2) through idler shaft bore (1013/10) in rear of gearbox.

(j) Install the bearing inner race (1013/8) inside the spur gear and bearing assembly flanged side away from the retaining ring.

(k) Install spur gear (1013/7), over threaded end of idler shaft, with bearing retaining ring (1013/5) toward rear wall of gearbox. Secure gear with new nut (1013/9).

(l) Align boltholes and insert spacer detail of PWA 86149 Wrench under flange of idler shaft. Secure idler shaft and spacer to gearbox with detail bolts. Using PWA 86149 Wrench, torque nut (1013/9) to 300 - 350 lb-in. (34 - 39 N.m).

(m) Remove detail bolts securing gearshaft and spacer. Remove spacer.

(n) Insert the end of the idler shaft into the bore in the front inner wall of the gearbox. Attach the shaft with two bolts (1013/1), threads lubricated with Anti-Sseize Paste P06-054. Remove the unwanted paste. Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m). (Pre SB PW4ENG 79-78) Safety the bolts with Lockwire P05-289.

Subtask 72-61-00-430-059-002:

(13) (Post SB PW4ENG 72-491) Install gearbox (idler) spur gear. See Figure 1013.

(a) Position spur gear (1013/7), stepped ID end down, into recess in PWA 85339 Base.

(b) Position bearing (1013/26) over bearing bore in gear.

(c) Position PWA 85338 Drift over outer race, with larger ID of drift over piloting pin detail of base.

(d) Use PWA 80130 Force Gage and an arbor press to apply a load of 1500 lb. (680.39 kg) to seat bearing.

(e) Remove gage and drift. Remove gear from base.

(f) Install retaining ring (1013/5) in groove in gear ID to hold outer race.

(g) Hold the gearbox idler shaft (1013/20) in a vise. Tighten on the flats of the shaft. Lubricate the shaft OD and the bearing ID with Engine Oil P03-001.

(h) Install the spur gear and bearing assembly on the gearbox idler shaft (1013/20), with the bearing outer race retaining ring towards the threads.

CAUTION: WHEN PWA 86149 WRENCH IS USED, THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT STATED BELOW. SEE STANDARD PRACTICES MANUAL, PN 585005.

(i) Install a new bearing retaining nut (1013/9) to hold the spur gear to the idler shaft.

(j) Hold the assembly in a vise and apply a torque of 525 − 575 lb−in. (59.316 − 64.966 N.m) to the retaining nut. Use PWA 86149 Wrench or PWA 85285 Wrench.

(k) Remove the assembly from the vise. Hold the assembly with the shaft horizontal and turn the gear with your hand. The gear must turn freely.

(l) If the gear does not turn freely do as follows:

1 Remove and discard the bearing retaining nut.

2 Remove the gear from the shaft and examine the shaft and bearing for the cause.

3 If there is any damage replace the part.

4 If you do not find any damage, replace the bearing with a new bearing. Install a new bearing retaining nut.

5 Do again the bearing and retaining nut assembly and torque procedure. The gear must turn freely.

(m) Insert the gearbox idler shaft and gear assembly through the idler shaft bore (1013/10) in the rear of the gearbox.

NOTE: Make sure that the bearing retaining ring is rearward when the assembly is installed in the gearbox.

(n) Install the packing (1013/3), lubricated with Engine Oil P03−001, into the groove in the flanged end of the gearbox idler shaft boss assembly (1013/21).

(o) Install the gearbox idler shaft boss assembly (1013/21) to the gearbox idler shaft and assembly, previously installed in the gearbox. Align the slot in the shaft (1013/20) with the pin in the boss assembly (1013/21).

(p) Install the packing (1013/22), lubricated with Engine Oil P03-001, into the groove adjacent to the hex section of the oil supply adapter assembly (1013/23).

(q) Install the adapter assembly (1013/23) into the flange of the boss assembly (1013/21). Torque range for the fitting is 85 - 190 lb-in. (9.6 - 21.5 N.m). Adjust torque within these limits so that the lock plate (1013/24) can be installed around the hex of the oil supply fitting with the bolt hole in alignment with one of the boss flange holes.

(r) Install two bolts (1013/25), threads lubricated with Anti-Seize Paste P06-054 to hold the assembly to the gearbox. Remove the unwanted paste. Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m). (Pre SB PW4ENG 79-78) Safety the bolts with Lockwire P05-289.

Subtask 72-61-00-430-059-003:

(14) (Post SB PW4ENG 72-664) Install gearbox (idler) spur gear. See Figure 1013 (Sheet 3).

(a) Position spur gear (1013/38), stepped ID end down, into recess in PWA 85339 Base.

(b) Position bearing (1013/36) over bearing bore in gear. Align the slot in the bearing with the slot in the gear.

(c) Position PWA 85338 Drift over outer race, with larger ID of drift over piloting pin detail of base.

(d) Use PWA 80130 Force Gage and an arbor press to apply a load of 1500 lb. (680.39 kg) to seat bearing.

(e) Remove gage and drift. Remove gear from base.

MAIN GEARBOX - ASSEMBLY-01

(f) Install the pin (1013/37) into the hole, formed by the slot in the gear and the slot in the bearing. The pin should slide in without force.

NOTE: If the pin does not slide in, the slot in the bearing and the slot in the gear are not aligned correctly. If this occurs, remove the bearing from the gear and install the bearing to the gear again.

(g) Install bearing retaining ring (1013/5) in groove in gear ID to hold outer race and the pin.

(h) Hold the gearbox idler shaft (1013/20) in a vise. Tighten on the flats of the shaft. Lubricate the shaft OD and the bearing ID with Engine Oil P03-001.

(i) Install the spur gear and bearing assembly on the gearbox idler shaft (1013/20), with the bearing outer race retaining ring towards the threads.

(j) Install a new bearing retaining nut (1013/9) to hold the spur gear to the idler shaft.

R CAUTION: WHEN PWA 86149 WRENCH IS USED, THE
R REQUIRED TORQUE WRENCH INDICATION WILL
R BE LESS THAN THAT STATED BELOW. REFER TO
R STANDARD PRACTICES MANUAL, PN 585005,
R SECTION 70-52-00, STANDARD TORQUES.

(k) Hold the assembly in a vise and apply a torque of 525 - 575 lb-in. (59.316 - 64.966 N.m) to the retaining nut. Use PWA 86149 Wrench or PWA 85285 Wrench.

R (l) Force Engine Oil P03-001 through the hole in the
R idler shaft inner diameter until you see oil at
R the bearing thrust washer, which is below the
R retaining ring (1013/20) location.

R (m) Remove the assembly from the vise.

R (n) Hold the assembly with the idler shaft horizontal and turn the gear with your hand. The gear must turn freely.

R (o) If the gear does not turn freely do as follows:

1 Remove and discard the bearing retaining nut.

2 Remove the gear from the idler shaft and examine the shaft and bearing for the cause.

3 If there is any damage replace the part.

R 4 Put the idler shaft in a vise. Put the vise clamps on the flats of the shaft. Lubricate the shaft outer diameter and the bearing inner diameter with Engine Oil P03-001.

R 5 If you do not find any damage, replace the bearing with a new bearing.

R CAUTION: WHEN PWA 86149 WRENCH IS USED, THE REQUIRED TORQUE WRENCH INDICATION WILL BE LESS THAN THAT STATED BELOW. REFER TO STANDARD PRACTICES MANUAL, PN 585005, SECTION 70-52-00, STANDARD TORQUES.

R 6 Install a new bearing retaining nut. Torque the nut to 525 - 575 lbf-in (59.317 - 64.966 N.m). Use PWA 86149 Wrench or PWA 85285 Wrench to torque the nut.

R 7 Force Engine Oil P03-001 through the hole in the idler shaft inner diameter until you see oil at the bearing thrust washer, which is below retaining ring (1013/20) location.

R 8 Remove the assembly from the vise.

R 9 Hold the assembly with the idler shaft horizontal and turn the gear with your hand. The gear must turn freely.

R (p) Insert the gearbox idler shaft and gear assembly through the idler shaft bore (1013/10) in the rear of the gearbox.

NOTE: Make sure that the bearing retaining ring is rearward when the assembly is installed in the gearbox.

R (q) Install the packing (1013/3), lubricated with Engine Oil P03-001, into the groove in the flanged end of the gearbox idler shaft boss assembly (1013/21).

R (r) Install the gearbox idler shaft boss assembly (1013/21) to the gearbox idler shaft and assembly, previously installed in the gearbox. Align the slot in the shaft (1013/20) with the pin in the boss assembly (1013/21).

R (s) Install the packing (1013/22), lubricated with Engine Oil P03-001, into the groove adjacent to the hex section of the oil supply adapter assembly (1013/23).

R (t) Install the adapter assembly (1013/23) into the flange of the boss assembly (1013/21). Torque range for the fitting is 85 - 190 lb-in. (9.6 - 21.5 N.m). Adjust torque within these limits so that the lock plate (1013/24) can be installed around the hex of the oil supply fitting with the bolt hole in alignment with one of the boss flange holes.

R (u) Install the two bolts (1013/25), threads lubricated with Anti-Seize Paste P06-054 to hold the assembly to the gearbox. Remove the unwanted paste. Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m). (Pre SB PW4ENG 79-78) Safety the bolts with Lockwire P05-289.

Subtask 72-61-00-430-057:

(15) Install deoiler gearshaft and bearings assembly. See Figure 1014.

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(a) Align boltholes and install bearing outer race (1014/7) into bore in rear wall of gearbox housing behind deoiler pad (1014/6). Secure the outer race and if applicable the oil supply tube flange (1004/26) with four new bolts (1014/5) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(b) (Engines With The Alternate Lubrication Configuration) Tighten the clamp bolt (1004/27) that attaches the oil supply tube (1004/26) to the bracket (1004/29). Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install packing (1014/8), lubricated with Engine Oil P03−001, into groove in OD of bearing housing (1014/4).

(d) Mate roller bearing on gearshaft with previously installed bearing outer race on bearing housing detail (1014/4). Align boltholes in bearing housing with boltholes in deoiler pad (1014/6), and mate bearing on end of gearshaft with outer race in rear wall of gearbox housing. Seat bearing housing on deoiler pad.

(e) Install packing (1014/10), lubricated with Engine Oil P03−001, into groove in gearbox deoiler housing (1014/11). Align boltholes and position housing over deoiler gearshaft and seat on deoiler pad. Secure housing using eleven washers (1014/12) and new bolts (1014/13) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(f) Install packing (1014/3), lubricated with Engine Oil P03−001, into groove in OD of face (oil) seal (1014/2). Install seal, carbon seal towards gearshaft, into mating bore in rear of gearbox housing. Secure seal using retaining ring (1014/1).

NOTE: Before installing carbon seal, work seal thoroughly in engine oil to ensure free movement of carbon element. Carbon seal ring must have free axial movement without detectable binding throughout its full travel in seal carrier after immersion in engine oil, just prior to installation in gearbox assembly.

Subtask 72-61-00-430-058:

(16) Install main oil filter and pressure relief valve assembly. See Figure 1015.

(a) For engines that are pre SB PW4ENG 79-43, install the transfer tubes.

1 Install two packings (1015/1), lubricated with Engine Oil P03-001, into grooves in two larger packing transfer tubes (1015/2) and (1015/6).

2 Seat transfer tubes in two larger bores in main oil filter pad (1015/5) on right front side of gearbox.

3 Install two packings (1015/3), lubricated with Engine Oil P03-001, into grooves in smaller packing transfer tube (1015/4).

4 Seat transfer tube in remaining bore in main oil filter pad.

(b) For engines that are post SB PW4ENG 79-43, install the anti-siphon tube assembly and transfer tubes.

1 Apply Engine Oil P03-001 to four packings (1015/3) and (1015/1). Install the packings on transfer tubes (1015/4) and (1015/6), respectively.

2 Install the transfer tubes in the two lower holes in the main-oil-filter and pressure-relief-valve assembly (called main oil filter).

3 Find the correct position of the anti-siphon tube assembly (1015/2A) as follows.

a With no packings installed, put the eccentric flange of the tube assembly in the mating counterbore of the main oil filter.

b The fit of the main oil filter and the tube assembly is correct if the tube cannot turn much.

MAIN GEARBOX - ASSEMBLY-01

c With the main oil filter pointed in the installed position, see the position of the tube assembly.

d Remove the tube assembly.

4 Apply Engine Oil P03-001 to two packings.

5 Install the packings on the tube assembly.

6 Install the tube assembly in the front of the gearbox. The position of the tube assembly is the same as when it was installed in the main oil filter.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER MAIN-OIL-FILTER AND PRESSURE-RELIEFVALVE ASSEMBLY. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 79-43.

(c) Install the main oil filter.

1 Align boltholes and position main oil filter and pressure relief valve assembly (1015/7) onto main oil filter pad (1015/5).

NOTE: While you install the main oil filter and pressure relief valve assembly, it may be necessary to turn the anti-siphon tube a little to correctly engage the eccentrically shaped tube with its mating hole in the main oil filter housing.

2 Secure main oil filter to gearbox using four new bolts (1015/9) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034) and washers (1015/8). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005.

3 Do a check of the position of the anti-siphon tube assembly. The end of the tube assembly must be approximately 0.25 inch (6.350 mm) from the top of the gearbox housing.

4 Torque bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m).

Subtask 72−61−00−430−060:

(17) Install EEC alternator drive gearshaft and bearings assembly. See Figure 1016.

(a) Apply a thin layer of Engine Oil P03−001 to the ID of the mating bore in the main gearbox.

(b) Install packing (1016/5), lubricated with Engine Oil P03−001, into groove in OD of EEC alternator housing.

(c) Insert EEC alternator drive gearshaft and bearings assembly (1016/3), spur gear end first, into bore in EEC alternator drive pad (1016/4). Mesh gears and seat housing on drive pad.

(d) (Pre SB PW4ENG 75−59) Secure the assembly to gearbox with three new bolts (1016/1) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034) and two washers (1016/2) and a bracket (1016/6). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005.

(e) (Post SB PW4ENG 75−59) Secure a manifold (1016/7) and assembly to gearbox with three bolts (1016/1).

(f) (Post SB PW4ENG 72−375) Attach the housing to the gearbox with three new bolts (1016/1) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005.

(g) Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(h) Do a check of the clearance between the gearshaft housing and the main gearbox. Use a 0.003 inch (0.076 mm) feeler gage. If it is possible to put the gage between the housing and the main gearbox, the housing is not correctly installed. Do a check of the torque on the mounting bolts. If the bolts are at maximum torque, but the housing is not correctly installed, remove the gearshaft and bearings assembly and install the assembly again.

Subtask 72−61−00−430−061:

(18) Install starter drive gearshaft and bearings assembly. See Figure 1017.

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(a) Align boltholes and position mating bearing outer race (1017/8) into bore in rear side of front wall of gearbox housing behind starter drive pad (1017/7).Secure outer race using four new bolts (1017/6) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(b) Align boltholes and position mating bearing outer race (1017/10) into bore in rear side of bearing housing (1017/3). Secure outer race using four new bolts (1017/5) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(c) Insert starter drive gearshaft and bearings assembly (1017/9), smaller spur gear first, through bore in starter drive pad (1017/7). Mesh mating gears and mate roller bearing on gearshaft with bearing outer race in front wall of gearbox.

(d) Install packing (1017/4), lubricated with Engine Oil P03−001, into groove in OD of bearing housing (1017/3).

(e) Mate roller bearing outer race in bearing housing (1017/3) with rollers on gearshaft. Align boltholes and seat bearing housing on starter drive pad (1017/7). Secure bearing housing using eight new bolts (1017/1) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70−41−03−380−034) and washers (1017/2). Refer to Section 70−41−03 in the Standard Practices Manual, PN 585005. Torque bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(f) Install packing (1017/15), lubricated with Engine Oil P03−001, into groove in OD of face (oil) seal (1017/16). Install seal into bore in bearing housing (1017/3), seating carbon seal on sealing face of gearshaft. Install retaining ring (1017/17) into groove in bearing housing to secure seal.

NOTE: Before installing carbon seal, work seal thoroughly in engine oil to ensure free movement of carbon element. Carbon seal ring must have free axial movement without detectable binding throughout its full travel in seal carrier after immersion in engine oil, just prior to installation in gearbox assembly.

(g) Install packing (1017/11), lubricated with Engine Oil P03−001, onto bushing (1017/12). Install bushing, lubricated with Engine Oil P03−001, into port in bottom of bearing housing. Torque bushing to 250 − 275 lb−in. (20.246 − 31.071 N.m).

(h) Install packing (1017/13), lubricated with Engine Oil P03−001, onto plug (1017/14). Install plug, lubricated with Engine Oil P03−001, into bushing (1017/12). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Lockwire plug.

Subtask 72−61−00−430−062:

(19) Install rear hydraulic pump gearshaft and bearings assembly. See Figure 1018.

(a) Lubricate packings (1018/6), and threads on new nut (1018/8) with Engine Oil P03-001. Install packing (1018/6) into groove in bushing (1018/5). Install bushing into nozzle port (1018/7) in front, left, side of gearbox. Using PWA 85372 Wrench, secure bushing with nut (1018/8). Torque nut to 300 - 350 lb-in. (34 - 39 N.m).

(b) Install packings (1018/3) and (1018/4), lubricated with Engine Oil P03-001, into grooves in gearbox nozzle (1018/2). Install nozzle, lubricated with Engine Oil P03-001, into previously installed adapter (1018/5). Torque nozzle to 90 - 100 lb-in. (10.169 - 11.298 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(c) Align boltholes and position bearing outer race (1018/11) into bore in rear side of front wall of gearbox behind rear hydraulic pump drive pad (1018/1). Secure outer race using four bolts (1018/10). Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(d) Align boltholes and position bearing outer race (1018/13) into bearing outer race bore in bearing housing (1018/15). Secure outer race using four new bolts (1018/9) or bolts which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034). Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(e) Insert rear hydraulic pump drive gearshaft and bearings assembly (1018/12) spur gear end first, through bore in rear hydraulic pump drive pad (1018/1). Mesh mating gears and mate roller bearing on gearshaft with previously installed bearing outer race in rear side, front wall, of gearbox.

MAIN GEARBOX - ASSEMBLY-01

(f) Install packing (1018/14), lubricated with Engine Oil P03-001, into OD groove in bearing housing (1018/15).

(g) Mate roller bearing outer race in bearing housing (1018/15) with rollers on gearshaft. Position bearing housing over studs projecting from rear hydraulic pump drive pad and seat bearing housing on pad (1018/1). Install two new screws (1018/20) or screws which have the antigalling compound replaced by SPOP 139 (Task 70-41-03-380-034), into smaller chamfered holes in outer flange of bearing housing. Refer to Section 70-41-03 in the Standard Practices Manual, PN 585005. Torque screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

(h) Install packing (1018/21), lubricated with Engine Oil P03-001, into groove in OD of face (oil) seal (1018/22). Install seal into bore in bearing housing (1018/15), seating carbon seal on sealing face of gearshaft. Install retaining ring (1018/23) into groove in bearing housing to secure seal.

NOTE: Before installing carbon seal, work seal thoroughly in engine oil to ensure free movement of carbon element. Carbon seal ring must have free axial movement without detectable binding throughout its full travel in seal carrier after immersion in engine oil, just prior to installation in gearbox assembly.

(i) Lubricate packing (1018/16) and threads of bushing (1018/17) with Engine Oil P03-001. Install bushing into port in bottom of bearing housing. Torque bushing to 250 - 275 lb-in. (28.246 - 31.071 N.m).

(j) Lubricate packing (1018/19) and threads of plug (1018/18) with Engine Oil P03-001. Install plug into bushing in port in bottom of bearing housing. Torque plug to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(k) For those engines not utilizing a rear hydraulic pump, install the rear hydraulic pump drive bolt, plug and cover. See Figure 1019.

1 Install packing (1019/8), lubricated with Engine Oil P03-001, in groove of bolt (1019/9), lubricated with Engine Oil P03-001, nearest bolthead. Install bolt and packing assembly in gearshaft, seating bolthead in groove in gearshaft internal splines.

2 Install packing (1019/7), lubricated with Engine Oil P03-001, in groove of plug (1019/6), lubricated with Engine Oil P03-001. Install plug over bolt, plugging gearshaft opening.

3 Install washer (1019/5) and nut (1019/4), lubricated with Engine Oil P03-001, over bolt. Torque nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

4 Install gasket (1019/3) and cover (1019/2), over rear hydraulic pump pad studs. Secure with four hydraulic pump nuts (1019/1). Torque nuts, lubricated with Engine Oil P03-001, to 275 - 300 lb-in. (31.071 - 33.895 N.m).

D. Postrequisites

(1) Assemble front hydraulic pump drive and IDG drive gearshaft to main gearbox per 72-61-00, Assembly-02 (Task 72-61-00-400-002).

(2) Install the drain plugs and lube oil tank on the main gearbox. Refer to 72-61-00, Assembly-03 (Task 72-61-00-400-003).

(3) Install the magnetic chip detector assemblies in the main gearbox, lube oil tank, and lubrication and scavenge oil pump. Refer to 72-61-00, Assembly-07 (Task 72-61-00-400-007).

(4) Do a leak check of the main gearbox. Refer to 72-61-00, Testing-01 (Task 72-61-00-790-001).

(5) Install the brackets, EEC alternator rotor and stator, and the lubrication and scavenge oil pump on the main gearbox. Refer to 72-61-00, Assembly-06 (Task 72-61-00-400-006).

MAIN GEARBOX - ASSEMBLY-02

Task 72-61-00-400-002:

1. Assemble Front Hydraulic Pump Drive And IDG Drive Gearshaft To Main Gearbox

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble main gearbox per Assembly-01 (Task 72-61-00-400-001).

(3) Assemble IDG drive gearshaft and bearings assembly per 72-61-06 (Task 72-61-06-440-001).

(4) Assemble front hydraulic pump drive gearshaft and bearings assembly per 72-61-07 (Task 72-61-07-440-001).

B. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Lockwire, AS3214-02		

MAIN GEARBOX − ASSEMBLY−02

C. Procedure

Subtask 72−61−00−430−064:

(1) Install IDG drive gearshaft and bearings assembly. See Figure 1001.

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER. MATING NUMBERS ARE MARKED ON DETAIL PARTS OF BEARING.

(a) Align boltholes and position bearing outer race (1001/15) into bore in rear side of bearing housing (1001/6). Secure outer race using four bolts (1001/14). Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(b) Insert IDG drive gearshaft and bearings assembly (1001/13), smaller spur gear end first, through bore in IDG drive pad (1001/12). Mesh mating gears and mate roller bearing on gearshaft with previously installed bearing outer race in front wall of gearbox.

(c) Install packing (1001/7), lubricated with Engine Oil P03−001, into groove in OD of bearing housing (1001/6).

(d) Mate previously installed roller bearing outer race in bearing housing with rollers on gearshaft. Align boltholes and seat bearing housing on IDG drive pad (1001/12). Secure bearing housing with 12 washers (1001/5) and bolts (1001/4). Torque bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(e) Install packing (1001/3), lubricated with Engine Oil P03−001, into groove in OD of face (oil) seal (1001/2).

(f) Install seal into seal bore in bearing housing (1001/6), seating carbon seal on sealing face of gearshaft. Install retaining ring (1001/1) into groove in bearing housing to secure seal.

(g) Lubricate packing (1001/8) and threads of bushing (1001/11) with Engine Oil P03−001. Install bushing into port in bottom of bearing housing. Torque bushing to 250 − 275 lb−in. (28.246 − 31.071 N.m).

(h) Lubricate packing (1001/9) and threads of plug (1001/10) with Engine Oil P03−001. Install plug into installed bushing (1001/11). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Lockwire plug.

(i) For those engines not utilizing an IDG, install the IDG drive bolt, plug and cover. See Figure 1002.

1 Lubricate packing (1002/9) and bolt (1002/10) with Engine Oil P03−001. Install packing in groove of bolt nearest bolthead. Install bolt and packing assembly in gearshaft, seating bolthead in groove in gearshaft internal splines.

2 Install packing (1002/8) lubricated with Engine Oil P03−001, in groove of plug (1002/7), lubricated with Engine Oil P03−001. Install plug over bolt, plugging gearshaft opening.

3 Install washer (1002/6) and nut (1002/5), lubricated with Engine Oil P03−001, over bolt. Torque nut to 85 − 95 lb−in. (9.604 − 10.734 N.m).

4 Install gasket (1002/4) and cover (1002/3) and secure with eight washers (1002/2) and eight bolts (1002/1). Torque bolts to 225 − 250 lb−in. (25.422 − 28.246 N.m).

Subtask 72−61−00−430−065:

(2) Install front hydraulic pump drive gearshaft and bearings assembly. See Figure 1003.

(a) Install packing (1003/8), lubricated with Engine Oil P03−001, into groove in rear OD of bearing housing (1003/2).

(b) Align boltholes in rear flange of bearing housing with boltholes in front hydraulic pump drive pad (1003/7). Seat housing on drive pad. Secure assembly with eight washers (1003/9) and bolts (1003/10). Torque bolts to 225 − 250 lb−in. (25.422 − 28.246 N.m).

MAIN GEARBOX - ASSEMBLY-02

(3) Install new packing (1003/11), lubricated with Engine Oil P03-001, into groove in OD of bearing support (1003/1).

(4) Align boltholes and install gearshaft and bearing support assembly, slot up, in bearing housing (1003/2). Secure bearing support with four bolts (1002/12). Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(5) Install new packings (1003/5) and (1003/6), lubricated with Engine Oil P03-001, into grooves in nozzle (1003/4). Aligning boltholes, install nozzle in port in boss at top of bearing housing (1003/2). Secure nozzle with two bolts (1003/3). Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(a) For those engines not utilizing a front hydraulic pump, install the front hydraulic pump drive bolt, plug and cover. See Figure 1004.

1 Install packing (1004/8) lubricated with Engine Oil P03-001, in groove of bolt (1004/9) lubricated with Engine Oil P03-001, nearest bolthead. Install bolt and packing assembly in gearshaft, seating head of bolt in groove in gearshaft internal splines.

2 Install packing (1004/7) lubricated with Engine Oil P03-001, in groove of plug (1004/6) lubricated with Engine Oil P03-001. Install plug over bolt, plugging gearshaft opening.

3 Install washer (1004/5) and nut (1004/4) lubricated with Engine Oil P03-001, over bolt. Torque nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

4 Install gasket (1004/3) and cover (1004/2) over bearing housing studs. Secure with four hydraulic pump nuts (1004/1) treated with Engine Oil P03-001. Torque nuts to 275 - 300 lb-in. (31.071 - 33.895 N.m).

D. Postrequisites

(1) Install the drain plugs and lube oil tank on the main gearbox. Refer to Assembly-03 (Task 72-61-00-400-003).

(2) Install the magnetic chip detector assemblies in the main gearbox, lube oil tank, and lubrication and scavenge oil pump. Refer to Assembly−07 (Task 72−61−00−400−007).

(3) Do a leak check of the main gearbox. Refer to Testing−01 (Task 72−61−00−790−001).

(4) Install the brackets, EEC alternator rotor and stator, and the lubrication and scavenge oil pump on the main gearbox. Refer to Assembly−06 (Task 72−61−00−400−006).

MAIN GEARBOX - ASSEMBLY-03

Task 72-61-00-400-003:

1. Assemble Drain Plugs And Lube Oil Tank Assembly To The Main Gearbox

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble main gearbox per Assembly-01 (Task 72-61-00-400-001).

(3) Assemble front hydraulic pump drive and IDG drive gearshaft to main gearbox per Assembly-02 (Task 72-61-00-400-002).

(4) Assemble lube oil tank and deaerator assembly per Assembly-05 (Task 72-61-00-400-005).

B. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-002	Petrolatum, White (PMC 9609)
R P06-054	Paste, Antiseize (PWA 36246)

Packing	1	72−61−00/15/120
Packing	1	72−61−00/15/1
Packing	1	79−11−00/1/20

C. Procedure

Subtask 72−61−00−430−063:

(1) Install drain plugs and bushings in gearbox housing. See Figure 1001.

(a) Lubricate packing (1001/2) and threads of bushing (1001/1) with Engine Oil P03−001. Assemble packing onto bushing and install bushing into magnetic plug port in lower center of gearbox. Torque bushing to 375 − 425 lb−in. (42.369 − 48.019 N.m).

(b) Lubricate packing (1001/6) and threads of bushing (1001/5) with Engine Oil P03−001. Assemble packing onto bushing. Install bushing into drain port in front of gearbox as shown in referenced figure. Torque bushing to 250 − 275 lb−in. (28.246 − 31.071 N.m).

(c) Lubricate packing (1001/4) and threads of plug (1001/3) with Engine Oil P03−001. Assemble packing onto plug and install plug into previously installed bushing (1001/5). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the plug.

(d) Lubricate packing (1001/10) and threads of bushing (1001/9) with Engine Oil P03−001. Assemble packing onto bushing. Install bushing into drain port in lower front side of gearbox as shown in referenced figure. Torque bushing to 250 − 275 lb−in. (28.246 − 31.071 N.m).

R
R

(e) Lubricate packing (1001/8) and threads of probe (1001/7) with Engine Oil P03-001. Assemble packing onto probe. Install probe into previously installed bushing (1001/9). Torque probe to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the probe.

(f) (Post SB PW4ENG 73-84) Install a new packing lubricated with Engine Oil P03-001 on removed EEC oil temperature thermocouple probe (1001/7A). Lubricate the threads of the probe with Engine Oil P03-001 and insert in bushing.

NOTE: Make sure the packing is installed in the groove on the concave end of the adapter and this end of the adapter is installed into the main gearbox assembly.

(g) Torque nuts on thermocouple as follows:

1 (Reference 571) Remove the lockwire between the body nut (adapter) and coupling nut. Loosen the coupling nut from the body nut (adapter). Torque the body nut (to the housing) to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the body nut (adapter) to the gearbox lug.

2 Turn the probe so the two larger studs are on the bottom and slightly outward from the engine centerline. See the figure.

3 (Reference 572) Torque the coupling to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the coupling nut to the body nut (adapter).

(h) Lubricate packing (1001/14) and threads of bushing (1001/13) with Engine Oil P03-001. Assemble packing onto bushing. Install bushing into drain port in front side of gearbox as shown in referenced figure. Torque bushing to 250 - 275 lb-in. (28.246 - 31.071 N.m).

MAIN GEARBOX − ASSEMBLY−03

(i) Lubricate packing (1001/12) and threads of plug (1001/11) with Engine Oil P03−001. Assemble packing onto plug. Install plug into previously installed bushing (1001/13). Torque plug to 150 − 170 lb−in. (16.948 − 19.207 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the plug.

Subtask 72−61−00−430−069:

CAUTION: DO NOT TRUNNION GEARBOX WITH LUBE OIL TANK INSTALLED OR DAMAGE TO TANK WILL RESULT.

(2) Install lube oil tank assembly. See Figure 1002 and Figure 1003.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER OIL CHECK VALVE ASSEMBLY. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 79−43.

(a) Install packings (1002/3) and (1002/5), lubricated with Engine Oil P03−001, into smaller and larger grooves respectively of oil check valve assembly (1002/4). Install oil check valve assembly, larger OD, into upper bore in oil tank housing (1002/6). For gearboxes that are Post SB PW4ENG 79−43, install a gasket on the oil check valve assembly.

(b) Install packing (1002/1), lubricated with Engine Oil P03−001, into groove in oil check valve housing (1002/2) or (1002/2A). Align boltholes and install housing over previously installed oil check valve assembly, tube up. Secure housing
R with two bolts (1002/10), treated with Antiseize
R Paste P06−054. Wipe off unwanted paste. Torque bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m).

(c) Install packing (1002/7), lubricated with Engine Oil P03−001, onto groove in sealing sleeve (1002/8). Install sealing sleeve into center bore in pad in oil tank housing. Secure sealing sleeve
R with two bolts (1002/9), treated with Antiseize
R Paste P06−054. Wipe off unwanted paste. Torque bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m).

MAIN GEARBOX - ASSEMBLY-03

(d) Install two packings (1002/11), lubricated with Engine Oil P03-001, into grooves in transfer packing tube (1002/13). Align boltholes and install tube (flanged end in) into lower bore in pad in oil tank housing. Secure tube with two
R bolts (1002/12), treated with Antiseize Paste
R P06-054. Wipe off unwanted paste. Torque bolts to 54 - 60 lb-in. (6.101 - 6.779 N.m).

(e) Install packing (1003/5), lubricated with Engine Oil P03-001, into groove in front OD of lube oil tank (1003/8).

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER LUBE OIL TANK. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 79-43.

(f) Align tubes in oil tank and gearbox with their mating sealing sleeves and seat oil tank on gearbox oil tank flange. Position oil tank heat shield (1003/1) to rear side of oil tank mounting flange to cover top and inboard side of oil tank. Align boltholes in mounting lugs of heat shield with boltholes in oil tank mounting flange. Secure bracket (Pre SB PW4ENG 79-48) (1003/3), oil tank, bracket (1003/6), bracket (Post SB PW4ENG 72-491) (1003/9) and heat shield with ten bolts (1003/2), lubricated with Engine Oil P03-001. Torque bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

CAUTION: MAKE SURE THAT THE TUBES IN THE OIL TANK CORRECTLY ENGAGE THE TUBES FROM THE GEARBOX. INCORRECT ENGAGEMENT OF THE TUBES CAN CAUSE AN IN-FLIGHT SHUTDOWN.

(g) Make sure that the oil tank is correctly installed as follows.

1 Look in the hole at the top of the oil tank.

2 With a mirror, do a check to be sure that the tubes inside the oil tank are engaged with the tubes from the main gearbox. Pay particular attention to the engagement of the breather tube (1003/4) with its mating tube.

(h) Position oil tank clamp (1003/7) around oil tank and groove in oil tank heat shield (1003/1). Secure clamp with detail screw, lubricated with Petrolatum White P06−002. (Reference 1121 and 2151) Torque screw to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(i) Install packing (1003/12), lubricated with Engine Oil P03−001, onto the groove in cover (1003/11) and install the cover to the flange of the hole at the top of the oil tank.

(j) (Pre SB PW4ENG 79−74) Attach the cover (1003/11) to the tank flange with six (6) bolts (1003/10) and nuts (1003/13). Torque nuts to 30 − 35 lb−in. (3.390 − 3.954 N.m).

(k) (Post SB PW4ENG 79−74) Install the oil tank heat shield bracket (1003/14) to the bottom of the flange at the top of the oil tank. Attach the cover (1003/11) and bracket (1003/14) to the tank flange with six (6) bolts (1003/10) and nuts (1003/13). Torque nuts to 30 − 35 lb−in. (3.390 − 3.954 N.m).

D. Postrequisites

(1) Install the magnetic plug assemblies in the main gearbox, lube oil tank, and lubrication and scavenge oil pump. Refer to Assembly−07 (Task 72−61−00−400−007).

(2) Do a leak check of the gearbox. Refer to Testing−01 (Task 72−61−00−790−001).

(3) Install the brackets, the EEC alternator rotor and stator, and the lubrication and scavenge oil pump on the main gearbox. Refer to Assembly−06 (Task 72−61−00−400−006).

MAIN GEARBOX - ASSEMBLY-04

Task 72-61-00-400-004:

1. Assemble Main Oil Filter, Housing And Pressure Relief Valves Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-61-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	72-61-00/11/100
Packing	1	79-21-00/2/20
Packing	1	79-21-00/2/30
Packing	1	79-21-00/2/50

Packing	1	79-21-00/2/230
Packing	1	79-21-00/2/250

C. Procedure
See Figure 1001 and Figure 1002.

MAIN GEARBOX − ASSEMBLY−04

Subtask 72−61−00−430−070:

(1) Position main oil filter housing (1001/11), large mounting flange side down, on bench. See Figure 1001.

(2) Install new packings (1001/9) and (1001/10), lubricated with Engine Oil P03−001, into grooves in relief valve housing (1001/8).

(3) Align bolt holes and install pressure relief valve housing (1001/8) in bore in pressure relief valve pad (1001/12).

(4) Position bracket (1001/7) over relief valve housing. Secure housing and bracket with three bolts (1001/6). Torque bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(5) Install new packing (1001/5), lubricated with Engine Oil P03−001, in groove in pressure relief valve (1001/4).

(6) Install pressure relief valve (1001/4), smaller OD end down, in bore in pressure relief valve housing (1001/8). Install spring (1001/3) in valve.

(7) Install new packing (1001/2), lubricated with Engine Oil P03−001, on relief valve plug (1001/1).

(8) Install plug, lubricated with Engine Oil P03−001, over spring (1001/3) and in pressure relief valve housing (1002/8). Torque plug to 650 − 750 lb−in. (73.440 − 84.738 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 plug.

(9) (Pre SB PW4ENG 72−524) Assemble the main oil filter housing, filter element and cover as follows. See Figure 1002 (Sheet 1) and Figure 1002 (Sheet 2).

    (a) Position main oil filter housing (1002/3), large mounting flange side down, on bench.

    (b) Align bolt hole and position key washer (1002/7) in center of cover (1002/15) with tab of key washer in mating hole in cover. Secure key washer with screw (1002/6), lubricated with Engine Oil P03−001. Torque screw to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install spring (1002/5) on key washer (1002/7). Bend tabs of washer out between coils of spring.

(d) Install new packing (1002/8), lubricated with Engine Oil P03−001, into groove in OD of main oil strainer cover (1002/15).

(e) Install filter element (1002/4), into opening in bottom of cover (1002/15), and align tabs of filter element with slots in ID of cover. Align bolt holes and install cover with filter element into main oil filter housing (1002/3).

NOTE: For this configuration, the oil filter element removable plug in the outboard end cap must be installed before installing the filter element into the cover.

(f) Install the cover (1002/15) as follows.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING BOLTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(g) With the cover (1002/15) in position on the housing (1002/3), carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING BOLTS TO THE TORQUE SPECIFIED.

(h) Attach the cover (1002/15) with four washers (1002/14) and bolts (1002/13). Torque bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(10) (Post SB PW4ENG 72−524 and Pre SB PW4ENG 79−79) Assemble the main oil filter housing, filter element and cover as follows. See Figure 1002 (Sheets 3) and Figure 1002 (Sheet 4).

MAIN GEARBOX − ASSEMBLY−04

(a) Position main oil filter housing (1002/3), large mounting flange side down, on bench.

(b) Align bolt hole and position key washer (1002/7) in center of cover (1002/15) with tab of key washer in mating hole in cover. Secure key washer with screw (1002/6), lubricated with Engine Oil P03−001. Torque screw to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install spring (1002/5) on key washer (1002/7). Bend tabs of washer out between coils of spring.

(d) Install new packing (1002/8), lubricated with Engine Oil P03−001, into groove in OD of main oil strainer cover (1002/15).

(e) Install filter element (1002/4) into opening in bottom of cover (1002/15), and align tabs of filter element with slots in ID of cover. Align bolt holes and install cover with filter element into main oil filter housing (1002/3).

NOTE: For this configuration, the oil filter element removable plug in the outboard end cap must be installed before installing the filter element into the cover.

(f) Install the cover (1002/15) as follows.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(g) With the cover (1002/15) in position over the studs in the housing (1002/3), carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: DO NOT INSTALL THE REMOVED LOCK NUTS; USE NEW NUTS. THE LOCK PROPERTY OF THE NUT DECREASES WITH USE. IF THE NUT BACKS OUT BECAUSE OF THE DECREASE IN LOCK PROPERTY, OIL LOSS AND AN IN−FLIGHT−SHUTDOWN CAN RESULT.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(h) Attach the cover (1002/15) to the housing.

1 If self−locking nuts are used, attach the cover to the housing with four (4) washers (1002/14) and nuts (1002/29). Lubricate the threads with Engine Oil P03−001. Torque nuts to 150 − 170 lb−in. (16.948 − 19.207 N.m).

2 If hex nuts with lockwire provisions are used, attach the cover to the housing with four (4) washers (1002/14) and nuts (1002/30). Lubricate the threads with Engine Oil P03−001. Torque nuts to 125 − 150 lb−in. (14.123 − 16.948 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the nuts.

(11) (Post SB PW4ENG 72−524 and SB PW4ENG 79−79) Assemble the main oil filter housing, filter element and cover as follows. See Figure 1002 (Sheets 5) Figure 1002 (Sheets 6).

(a) Position main oil filter housing (1002/3), large mounting flange side down, on bench.

(b) Install the spring (1002/5) in the spring retainer (1002/23).

(c) Install two screws (1002/22) through the spring retainer screw holes and then install two washers (1002/20) on the ends of the two screws.

(d) Lubricate the threads of the two screws (1002/22) with Engine Oil P03−001.

(e) With the spring (1002/5) in place in the spring retainer (1002/23), thread the two screws (1002/22) into the main oil strainer cover (1002/21). Torque the two screws to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Install new packing (1002/8), lubricated with Engine Oil P03−001, into groove in OD of main oil strainer cover (1002/21).

(g) Install filter element (1002/4) into opening in bottom of cover (1002/21), and align tabs of filter element with slots in ID of cover. Align bolt holes and install cover with filter element into main oil filter housing (1002/3).

NOTE: For this configuration, the oil filter element removable plug in the outboard end cap must be removed before installing the filter element into the cover.

(h) Install the cover (1002/21) as follows.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(i) With the cover (1002/21) in position over the studs in the housing (1002/3), carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: DO NOT INSTALL THE REMOVED LOCK NUTS; USE NEW NUTS. THE LOCK PROPERTY OF THE NUT DECREASES WITH USE. IF THE NUT BACKS OUT BECAUSE OF THE DECREASE

IN LOCK PROPERTY, OIL LOSS AND AN IN−FLIGHT−SHUTDOWN CAN RESULT.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(j) Attach the cover (1002/21) to the housing.

1 If self−locking nuts are used, attach the cover to the housing with four (4) washers (1002/14) and nuts (1002/29). Lubricate the threads with Engine Oil P03−001. Torque nuts to 150 − 170 lb−in. (16.948 − 19.207 N.m).

2 If hex nuts with lockwire provisions are used, attach the cover to the housing with four (4) washers (1002/14) and nuts (1002/30). Lubricate the threads with Engine Oil P03−001. Torque nuts to 125 − 150 lb−in. (14.123 − 16.948 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the nuts.

(12) Install new packing (1002/9), lubricated with Engine Oil P03−001, onto insert (1002/10).

(13) Install insert, lubricated with Engine Oil P03−001, into opening in bottom of cover (1002/15 or 1002/21, as appropriate). Torque insert to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(14) Install new packing (1002/11), lubricated with Engine Oil P03−001, onto plug (1002/12).

(15) Install plug (1002/12), lubricated with Engine Oil P03−001, into previously installed insert (1002/10). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 plug.

(16) Install packings (1002/2), lubricated with Engine Oil P03−001, onto two inserts (1002/1). Install inserts, lubricated with Engine Oil P03−001, into two upper ports in main oil filter housing (1002/3). Torque inserts to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(17) Install packings (1002/17) and (1002/18), lubricated with Engine Oil P03−001, into grooves in pressure relief valve (filter element) (1002/19). Install valve, threads lubricated with Engine Oil P03−001, onto port just above pressure (regulator) relief valve pad (1002/16). Torque valve to 525 − 625 lb−in. (959.317 − 70.615 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 valve.

(18) (Post SB PW4ENG 72−525) Assemble the main oil filter housing, filter element and cover as follows. See Figure 1002 (Sheets 7) Figure 1002 (Sheets 8).

(a) Position main oil filter housing (1002/3), large mounting flange side down, on bench.

(b) Install pressure relief valve (1002/41) in center of cover (1002/42) and attach with retaining ring (1002/40).

(c) Install new packing (1002/8), lubricated with Engine Oil P03−001, into groove in OD of main oil strainer cover (1002/42).

(d) Remove the protective closure from the end of the filter element (1002/39).

(e) Install the filter element (1002/39) over the pressure relief valve (1002/41) in cover (1002/42). Align tabs of filter element with slots in ID of cover. Align bolt holes and dowel pin in cover with studs and dowel pin hole in main oil filter housing (1002/3), then install cover with filter element into main oil filter housing.

NOTE: For this configuration, the oil filter element removable plug in the outboard end cap must be removed before installing the filter element into the cover.

(f) Install the cover (1002/42) as follows.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(g) With the cover (1002/42) in position over the studs and dowel pin hole in the housing, carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: DO NOT INSTALL THE REMOVED LOCK NUTS; USE NEW NUTS. THE LOCK PROPERTY OF THE NUT DECREASES WITH USE. IF THE NUT BACKS OUT BECAUSE OF THE DECREASE IN LOCK PROPERTY, OIL LOSS AND AN IN−FLIGHT−SHUTDOWN CAN RESULT.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(h) Attach the cover (1002/42) to the housing.

1 If self−locking nuts are used, attach the cover to the housing with four (4) washers (1002/14) and nuts (1002/29). Lubricate the threads with Engine Oil P03−001. Torque nuts to 150 − 170 lb−in. (16.948 − 19.207 N.m).

2 If hex nuts with lockwire provisions are used, attach the cover to the housing with four (4) washers (1002/14) and nuts (1002/30). Lubricate the threads with Engine Oil P03−001. Torque nuts to 125 − 150 lb−in. (14.123 − 16.948 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the nuts.

(19) (Post SB PW4ENG 72−525) Install new packing (1002/11), lubricated with Engine Oil P03−001, onto plug (1002/12).

(20) (Post SB PW4ENG 72−525) Install plug (1002/12), lubricated with Engine Oil P03−001, into threaded hole in bottom of cover (1002/42). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 plug.

(21) (Post PW4ENG 72−525) Install packings (1002/2), lubricated with Engine Oil P03−001, onto two inserts (1002/1). Install inserts, lubricated with Engine Oil P03−001, into two upper ports in main oil filter housing (1002/3). Torque inserts to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(22) (Post PW4ENG 72−525) Install packings (1002/17) and (1002/18), lubricated with Engine Oil P03−001, into grooves in plug (1002/43). Install plug, threads lubricated with Engine Oil P03−001, in port just above pressure (regulator) relief valve pad (1002/16). Torque plug to 525 − 625 lb−in. (59.317 − 70.615 N.m). Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 plug.

(Task 72−61−00−400−004)

Task 72-61-00-400-005:

1. Assemble The Lube Oil Tank And Deaerator Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-61-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire
R	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

	PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
	Packing	2	79-11-00/1/40
	Packing	1	79-11-00/1/80
	Packing	1	79-11-00/2/100
	Packing	1	79-11-00/2/105
	Packing	1	79-11-00/3/10
	Packing	1	79-11-00/4/1
	Packing	1	79-11-00/4/60
R	Packing	1	79-11-00/4/80

C. Procedure

Subtask 72-61-00-430-071:

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER BREATHER TUBE ASSEMBLY, DEAERATOR, BAFFLE, AND OIL TANK. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 79-43.

(1) Install the oil tank breather tube assembly as follows. See Figure 1001.

(a) (Pre SB PW4ENG 79-34 and Post SB PW4ENG 79-81):

MAIN GEARBOX - ASSEMBLY-05

1 Apply Engine Oil P03-001 to two packings (1001/5).

2 Install a packing at each end of the tube (1001/6).

3 Install the flanged end of the tube in the rear of the oil tank deaerator (1001/4).

4 Attach the tube to the deaerator with two bolts. Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(b) (Post SB PW4ENG 79-34 and Pre SB PW4ENG 79-81):

1 Apply Engine Oil P03-001 to two packings (1001/5).

2 Install a packing at each end of the tube (1001/7).

3 Install the flanged end of the tube in the rear of the oil tank deaerator (1001/4).

4 Install the bracket on the tube assembly.

5 Loosely attach the bracket and tube assembly to the deaerator with two bolts.

6 Install clamps on the tube assembly.

7 Apply Engine Oil P03-001 to the threads of two clamp bolts.

8 Loosely attach the clamps to the bracket with the bolts.

9 Find the correct position of the tube assembly. To do this, align the tube assembly with the mating holes in the gearbox housing. Adjust the tube assembly as necessary.

10 Torque the bolts that attach the tube assembly to the deaerator to 62 - 72 lb-in. (7.005 - 8.135 N.m). Torque the clamp-bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(2) Install the sealing sleeve (1001/2):

(a) Apply Engine Oil P03−001 to a packing (1001/3).

(b) Install the packing on the sleeve.

(c) Install the sleeve in the hole of the deaerator (1001/4) that is behind the front hole of the deaerator.

(d) Attach the sleeve to the deaerator with two bolts (1001/1). Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(3) Install the oil tank deaerator (1002/1) as follows. See Figure 1002.

(a) Attach the deaerator to the inner flange of the oil tank (1002/2) with seven washers (1002/3) and seven bolts (1002/4). Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(4) Install the oil tank baffle (1002/5):

(a) Apply Engine Oil P03−001 to seven bolts (1002/6).

(b) Attach the baffle to the inner flange of the oil tank with the seven bolts. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(5) If not installed, install the oil tank cap (1003/1) and related parts. This procedure is for an oil tank with either no remote filler or post SB PW4ENG 79−47. See Figure 1003.

(a) Align the oil tank sump (1003/7) on the oil tank boss.

(b) Install the filler neck valve (1003/5):

1 Look under the valve of the filler neck valve. If there is no packing (1003/8) there, install one that is lubricated with Engine Oil P03−001.

2 Apply Engine Oil P03−001 to a packing (1003/6) and the threads of six bolts (1003/4).

3 Put one of the bolts in the hole of the oil tank cap lanyard (1003/3).

4 Attach the filler neck valve and the oil tank sump to the oil tank with the six bolts. Torque the bolts to 32 - 36 lb-in. (3.616 -
R 4.067 N.m). Install the Lockwire P05-289 or
R Safety Cable P05-291 and Safety Cable Ferrule
R P05-292.

(c) Install the oil tank cap (1003/1):

1 Apply Engine Oil P03-001 to a packing (1003/2). Install the packing on the oil tank cap.

2 Put the cap in the filler neck valve. Turn the cap clockwise to CLOSE.

(6) If not installed, install the oil tank cap (1004/1) and related parts. The procedure is for an oil tank with a remote filler and pre SB PW4ENG 79-47. See Figure 1004.

(a) Install the connector (remote filler) (1004/9):

1 Apply Engine Oil P03-001 to a packing (1004/13) and the the threads of four bolts (1004/12).

2 Install the packing on the connector.

3 Attach the connector to the oil tank with the four bolts. Torque the bolts to 32 - 36 lb-in.
R (3.616 - 4.067 N.m). Install the Lockwire
R P05-289 or Safety Cable P05-291 and Safety
R Cable Ferrule P05-292.

4 If applicable, install the plugs (1004/11 and 1004/15):

a Apply Engine Oil P03-001 to two packings (1004/10 and 1004/14) and the threads of the two plugs.

b Put the packings on the plugs.

c Install the plugs. Torque plug (1004/11) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Torque plug (1004/15) to 110 - 120 lb-in.
R (12.428 - 13.558 N.m). Install the Lockwire
R P05-289 or Safety Cable P05-291 and Safety
R Cable Ferrule P05-292.

(b) Install the filler neck valve (1004/3):

1 Align the oil tank sump (1004/8) on the connector.

2 Apply Engine Oil P03-001 to a packing (1004/6) and the threads of two bolts (1004/7) and four bolts (1004/4).

3 Install the packing on the filler neck valve.

4 Put one of the bolts in the hole of the oil tank cap lanyard (1004/5).

5 Attach the filler neck valve, oil tank sump, and connector to the oil tank with the two long bolts at Locations C.

6 Attach the filler neck valve and oil tank sump to the connector with the four short bolts and nuts (1004/16) at Locations B.

7 Torque the short bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

8 Torque the long bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m). (Pre SB PW4ENG 79-78) Safety the
R bolts with Lockwire P05-289 or Safety Cable
R P05-291 and Safety Cable Ferrule P05-292.

(c) Install the oil tank cap (1004/1):

1 Apply Engine Oil P03-001 to a packing (1003/2). Install the packing on the oil tank cap.

2 Put the cap in the filler neck valve. Turn the cap clockwise to CLOSE.

D. Postrequisites

(1) Install the oil tank sight gage. Refer to 72-00-61, Installation-31 Task 72-00-61-450-013.

Task 72-61-00-400-006:

1. Install The EEC Rotor And Stator And The Lubrication And Scavenge Oil Pump And Brackets On The Main Gearbox

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque the retaining nut as follows.

(2) Assemble the main gearbox. Refer to Assembly-01 (Task 72-61-00-400-001).

(3) Assemble the front hydraulic pump drive and IDG drive gearshaft to the main gearbox. Refer to Assembly-02 (Task 72-61-00-400-002).

(4) Assemble the drain plugs and lube oil tank assembly to the main gearbox. Refer to Assembly-03 (Task 72-61-00-400-003).

(5) Install the magnetic chip detector assemblies in the main gearbox, lube oil tank, and lubrication and scavenge oil pump. Refer to Assembly-07 (Task 72-61-00-400-007).

(6) Do a leak check of the main gearbox. Refer to Testing-01 (Task 72-61-00-790-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 85238	Wrench (Optional To PWA 86603)
PWA 86603	Adapter, Holding

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-002	Petrolatum, White (PMC 9609)
P06-021	Antigalling Compound (PWA 550)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Nut	1	72−61−00/4/190
Packing	1	73−23−00/2/1
Packing	2	79−21−00/1/30
Packing	2	79−21−00/1/40
Packing	2	79−21−00/1/60

C. Procedure

Subtask 72−61−00−430−068:

CAUTION: DO NOT TURN THE GEARBOX TO PUT THE OIL TANK UNDER THE GEARBOX. TO DO SO WILL CAUSE DAMAGE TO THE OIL TANK.

(1) Install brackets. See Figure 1001.

(a) Install the brackets that follow on the front face of the gearbox.

Bracket	Bolt (Quantity)	Nut (Quantity)	Torque lb-in. (N.m)	Material Treatment
2	1 (3)		85 − 95 (9.604 − 10.734)	P03−001
3	4 (2)		85 − 95 (9.604 − 10.734)	P03−001
6	5 (2)	7 (2)	85 − 95 (9.604 − 10.734	P03−001
8	9 (2)		85 − 95 (9.604 − 10.734)	P03−001
17	16 (2)		85 − 95 (9.604 − 10.734)	P03−001
or				
17A	16 (2)		85 − 95 (9.604 − 10.734)	P03−001
19	18 (2)	20 (2)	85 − 95 (9.604 − 10.734)	P03−001

CAUTION: YOU MUST USE EEC GENERATOR STATOR PN 50R351 WITH BRACKETS PN 50R349−01 AND PN 52T618−01.

CAUTION: YOU MUST USE EEC GENERATOR STATOR PN 50R293 WITH BRACKETS PN 50R339 AND PN 52T098.

(b) Install the following brackets on rear face of gearbox.

Bracket	Bolt (Quantity)	Torque lb−in. (N.m)	Material Treatment	Nut (Quantity)
*11	10 (2)	62 − 72 (7.005 − 8.135)	None	
or				
**11A	10 (2)	62 − 72 (7.005 − 8.135)	None	
13	12 (2)	62 − 72 (7.005 − 8.135)	None	
14	15 (3)	85 − 95 (9.604 − 10.734)	None	
20	22 (2)	85 − 95 (9.604 − 10.734)	P03−001	21 (2)

*(Pre SB PW4ENG 72−375)
**(Post SB PW4ENG 72−375)

Subtask 72−61−00−430−067:

(2) Install EEC alternator rotor and stator (Pre SB PW4ENG 72−375). See Figure 1002.

(a) Remove protective closures.

CAUTION: ENSURE ROTOR IS FULLY SEATED ON GEARSHAFT.

(b) Install EEC alternator rotor (1002/8) on gearshaft (1002/9).

(c) Install EEC alternator rotor lock (1002/7) over gearshaft aligning ID flats on lock with flats on shaft and seat against rotor, engaging pins on lock with holes in rotor.

(d) Lubricate new nut (1002/6) with Engine Oil P03−001. Secure rotor and lock to gearshaft with nut.

(e) (Reference 570) Torque nut (1003/7) using PWA 86603 Adapter or PWA 85238 Wrench. See Figure 1003.

1 Loosen both jamnuts (1003/4) and retract wrench detail (1003/5) from body of wrench. Insert lug end of handle (1003/3) over mating lug end of wrench detail (1003/5).

2 Align boltholes and position body (1003/2) over EEC gearshaft and onto gearshaft housing (1003/1) pad. Engage lugs of wrench detail with slots in gearshaft. Secure body (1003/2) with three screws (1003/6).

3 Seat wrench detail (1003/5) firmly on gearshaft and secure with jamnuts.

CAUTION: WHEN YOU USE THE ADAPTER OR WRENCH THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT STATED BELOW. SEE STANDARD PRACTICES MANUAL, 70−52.

4 Engage lugs of handle with mating lugs in nut. Using handle, torque nut to 675 − 800 lb−in. (76.265 − 90.388 N.m).

(f) Lubricate packing (1002/5) with Petrolatum White P06−002, and install on EEC alternator stator (1002/4).

(g) Align boltholes in stator with boltholes on gearbox, and carefully install stator over rotor.

(h) Secure EEC alternator stator to gearbox as follows:

1 (Pre SB PW4ENG 75−59) Align boltholes in the heat shield (1002/2) with the boltholes at top of the stator flange. Secure the heat shield and stator to the gearbox with one washer (1002/3) and three bolts (1002/1).

2 (Post SB PW4ENG 75−59) Secure stator to gearbox with three bolts (1002/1).

(i) Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(j) Do a check of the clearance between the stator and the EEC drive gearshaft housing mount flange. Use a 0.003 inch (0.076 mm) feeler gage. If it is possible to put the gage between the stator and the housing the stator is not correctly installed. Do a check of the torque of the stator bolts. If the bolts are at the maximum torque and the stator is not correctly installed, remove the stator and install it again. Do the check again.

(k) Secure lower alternator cable as follows:

1 (Pre SB PW4ENG 75−59) Install a clamp (1004/1) on lower cable and secure to bracket below alternator with bolt, threads lubricated with Engine Oil P03−001.

2 (Post SB PW4ENG 75−59) Install clamps (1004/1) on lower cable and secure to legs on cooling manifold, below the alternator with bolts, threads lubricated with Engine Oil P03−001.

3 Torque bolt or bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 1004.

(l) Insert ends of cable in bracket on lower left side of gearbox. With plate spacers facing bracket, secure cable ends with plate and two bolts (1004/4) and (1004/5). Lubricate threads of bolt (1004/5) with Antigalling Compound P06−021. Torque bolt to 62 − 72 lb−in. (7.005 − 8.135 N.m). Lubricate threads of other bolt (1004/4) with Engine Oil P03−001. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(m) Secure cables to spring clips (1004/2) and (1004/3).

(3) Install EEC alternator rotor and stator (Post SB PW4ENG 72−375). See Figure 1005.

(a) Remove protection covers.

CAUTION: MAKE SURE THE ROTOR IS FULLY AGAINST (SEATED) THE GEARSHAFT. DO NOT USE INDUCTION HEATING TO ASSEMBLE THE PMA ROTOR ASSEMBLY. INDUCTION HEATING CAN DAMAGE THE MAGNETIC MATERIAL IN THE ROTOR.

(b) Install the EEC alternator rotor (1005/5) on the gearshaft (1005/6).

CAUTION: WHEN USING THE FOLLOWING ADAPTER THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT STATED BELOW. SEE STANDARD TORQUES, STANDARD PRACTICES SECTION.

(c) (Reference 570) Lubricate the nut with Engine Oil P03−001, and install the new nut (1005/4) to the gearshaft (1005/6). Torque the nut with PWA 86603 Adapter as follows. See Figure 1006.

1 Loosen both jamnuts (1006/4). While you hold the body (1006/2), loosen the wrench detail (1006/5).

2 Install the handle (1006/3), lug end facing outward, over the mating lug of wrench detail (1006/5).

3 Align boltholes and position wrench body (1006/2) over EEC gearshaft and onto the gearshaft housing (1006/1) pad.

4 Engage lugs of wrench detail with mating slots in gearshaft. Attach the body (1006/2) with three detail screws (1006/6).

5 Seat the wrench detail (1006/5) firmly on the gearshaft and tighten the jamnuts (1006/4).

6 Engage the lugs of handle (1006/3) with the mating lugs in the nut (1006/7).

MAIN GEARBOX − ASSEMBLY−06

7 Using a standard 1/2 inch drive, torque the nut to 675 − 800 lb−in. (76.265 − 90.388 N.m), loosen to 0 torque, then torque again to 675 − 800 lb−in. (76.265 − 90.388 N.m).

NOTE: This must be done in several steps because the handle movement is limited. The handle must be removed and repositioned to the nut.

8 Remove the screws (1006/6) that attach the wrench to the gearbox and remove the adapter.

(d) Lubricate packing (1005/3) with Petrolatum White P06−002, and install on EEC alternator stator.

(e) Align boltholes in stator with boltholes on the gearbox, and carefully install stator over rotor.

(f) Attach the stator to the gearbox with three bolts, threads lubricated with Antigalling Compound P06−021, and tighten by hand.

(g) Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(h) Do a check of the clearance between the stator and the EEC drive gearshaft housing mount flange. Use a 0.003 inch (0.076 mm) feeler gage. If it is possible to put the gage between the stator and the housing the stator is not correctly installed. Do a check of the torque of the stator bolts. If the bolts are at the maximum torque and the stator is not correctly installed, remove the stator and install it again. Do the check again.

(i) Install cable connectors to the bracket on the lower left side of gearbox as follows. See Figure 1007.

1 Install ends of cable in bracket on lower left side of gearbox. With plate spacers facing bracket, install the retaining plate over connector flanges. Attach the retaining plate to the bracket with two bolts (1007/3) and (1007/4).

2 Lubricate threads of bolt (1007/4) with Antigalling Compound P06−021. Torque the bolt to 62 − 72 lb−in. (7.005 − 8.135 N.m).

3 Lubricate threads of bolt (1007/3) with Engine Oil P03−001. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

4 Install the cables to spring clips (1007/1) and (1007/2).

Subtask 72−61−00−430−066:

(4) Install lubrication and scavenge oil pump. See Figure 1008.

(a) Lubricate packings (1008/2) and (1008/4) with Engine Oil P03−001, and install packings to grooves on transfer tubes (1008/1) and (1008/3) respectively. Install transfer tubes to respective ports on lubrication and scavenge oil pump (1008/9).

(b) Lubricate two packings (1008/6) with Engine Oil P03−001, and install packings to grooves on oil pump.

(c) Install oil pump to gearbox lubrication and scavenge pump pad (1008/5), mating gear splines and aligning transfer tubes with their respective ports. Secure oil pump with washers (1008/7) and bolts (1008/8), lubricated with Engine Oil P03−001. Torque bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

Lubrication And Scavenge Oil Pump Installation
Figure 1008
(Task 72−61−00−400−006)

Task 72-61-00-400-007:

1. Install The Magnetic Chip Detector Assemblies In The Main Gearbox, Lubrication And Scavenge Oil Pump, And Lube Oil Tank

A. General

(1) To install a full magnetic plug assembly, first install the valve, then install the plug.

B. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-61-00/12/270
Packing	AR	72-61-00/12/287

C. Installation Of The Magnetic Chip Detectors

CAUTION: REMOVE THE PROTECTIVE COVERS FROM THE OPENINGS AS NECESSARY TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO INSTALL THE CHIP DETECTOR AS AN ASSEMBLY. YOU MUST REMOVE THE MAGNETIC PROBE FROM THE VALVE TO PREVENT DAMAGE TO THE PARTS.

(1) Install the magnetic chip detector to the engine oil tank. See Figure 1001.

(a) Install the PN 50R499 magnetic chip detector to the engine oil tank as follows:

1 If necessary, install the magnetic probe (1001/15) into the valve (1001/4) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (1001/2).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (1001/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the engine oil tank.

8 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (1001/3).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(b) Install the PN 50R485 magnetic chip detector to the engine oil tank as follows:

1 If necessary, install the magnetic probe (1001/9) into the valve (1001/7) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (1001/6).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (1001/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the engine oil tank.

8 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (1001/8).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(c) Install the PN 50R423 (option 1) magnetic chip detector to the engine oil tank as follows:

1 Apply Engine Oil P03−001 to the new packing (1001/1).

2 Install the new packing to the washer face of the valve (1001/10).

3 Install the valve into the engine oil tank.

4 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (1001/11).

7 Install the new packing to the groove on the magnetic probe (1001/12).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(d) Install the PN 50R423 (option 2) magnetic chip detector to the engine oil tank as follows:

1 Apply Engine Oil P03−001 to the new packing (1001/1).

2 Install the new packing to the washer face of the valve (1001/13).

3 Apply Engine Oil P03−001 to the new packing (1001/14).

4 Install the new packing to the ID of the valve.

5 Install the valve into the engine oil tank.

6 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (1001/15).

9 Install the new packing to the groove on the magnetic probe (1001/16).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(e) Install the PN 50R374 magnetic chip detector to the engine oil tank as follows:

1 Apply Engine Oil P03−001 to the new packing (1001/1).

2 Install the new packing to the washer face of the valve (1001/17).

3 Install the valve into the engine oil tank.

4 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (1001/18).

7 Install the new packing to the groove on the magnetic probe (1001/19).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

CAUTION: REMOVE THE PROTECTIVE COVERS FROM THE OPENINGS AS NECESSARY TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO INSTALL THE CHIP DETECTOR AS AN ASSEMBLY. YOU MUST REMOVE THE MAGNETIC PROBE FROM THE VALVE TO PREVENT DAMAGE TO THE PARTS.

(2) Install the four magnetic chip detectors to the lubrication and scavenge oil pump. See Figure 1002.

(a) Install the PN 50R342 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 Apply Engine Oil P03−001 to the new packing (1002/1).

2 Install the new packing to the washer face of the valve (1002/2).

3 Install the valve into the engine oil tank.

4 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (1002/3).

7 Install the new packing to the groove on the magnetic probe (1002/4).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

11 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(b) Install the PN 50R348 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 Apply Engine Oil P03−001 to the new packing (402/1).

2 Install the new packing to the washer face of the valve (1002/8).

3 Apply Engine Oil P03−001 to the new packing (1002/7).

4 Install the new packing to the ID of the valve.

5 Install the valve into the lubrication and scavenge oil pump.

MAIN GEARBOX − ASSEMBLY−07

6 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (1002/6).

9 Install the new packing to the groove on the magnetic probe (1002/5).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

13 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(c) Install the PN 50R492 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 If necessary, install the magnetic probe (1002/2) into the valve (1002/10) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (1002/9).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (1002/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the lubrication and scavenge oil pump.

8 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (1002/11).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

15 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(d) Install the PN 50R491 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 Apply Engine Oil P03−001 to the new packing (1002/1).

2 Install the new packing to the washer face of the valve (1002/16).

3 Apply Engine Oil P03−001 to the new packing (1002/15).

4 Install the new packing to the ID of the valve.

5 Install the valve into the lubrication and scavenge oil pump.

6 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (1002/14).

9 Install the new packing to the groove on the magnetic probe (1002/13).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

13 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(e) Install the PN 50R501 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 If necessary, install the magnetic probe (1002/20) into the valve (1002/18) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (1002/17).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (1002/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the lubrication and scavenge oil pump.

8 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (1002/19).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

CAUTION: REMOVE THE PROTECTIVE COVERS FROM THE OPENINGS AS NECESSARY TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO INSTALL THE CHIP DETECTOR AS AN ASSEMBLY. YOU MUST REMOVE THE MAGNETIC PROBE FROM THE VALVE TO PREVENT DAMAGE TO THE PARTS.

(3) Install the magnetic chip detector to the center front side of the main gearbox assembly. See Figure 1003.

(a) Install the PN 50R341 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 Apply Engine Oil P03−001 to the new packing (1003/1).

2 Install the new packing to the washer face of the valve (1003/2).

3 Install the valve into the center front side of the main gearbox assembly.

4 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (1003/3).

7 Install the new packing to the groove on the magnetic probe (1003/4).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(b) Install the PN 50R347 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 Apply Engine Oil P03−001 to the new packing (1003/1).

2 Install the new packing to the washer face of the valve (1003/5).

3 Apply Engine Oil P03−001 to the new packing (1003/6).

4 Install the new packing to the ID of the valve.

5 Install the valve into the center front side of the main gearbox assembly.

6 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

MAIN GEARBOX − ASSEMBLY−07

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (1003/7).

9 Install the new packing to the groove on the magnetic probe (1003/8).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(c) Install the PN 50R485 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 If necessary, install the magnetic probe (1003/12) into the valve (1003/10) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (1003/9).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (1003/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the center front side of the main gearbox assembly.

8 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (1003/11).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(d) Install the PN 50R484 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 Apply Engine Oil P03−001 to the new packing (1003/1).

2 Install the new packing to the washer face of the valve (1003/13).

3 Apply Engine Oil P03−001 to the new packing (1003/14).

4 Install the new packing to the ID of the valve.

5 Install the valve into the center front side of the main gearbox assembly.

6 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (1003/15).

9 Install the new packing to the groove on the magnetic probe (1003/16).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(e) Install the PN 50R499 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 If necessary, install the magnetic probe (1003/20) into the valve (1003/18) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (1003/17).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (1003/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the center front side of the main gearbox assembly.

8 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (403/19).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

D. Postrequisites

(1) Do a leak check of the main gearbox. Refer to Testing-01 (Task 72-61-00-790-001).

MAIN GEARBOX - STORAGE-01

Task 72-61-00-530-001:

1. Pack The Main Gearbox

A. Prerequisites

(1) Remove the main gearbox. Refer to 72-00-61, Removal-01 (Task 72-00-61-020-001) or Removal-33 (Task 72-00-61-020-003).

(2) Remove the lubrication and scavenge oil pump. Refer to 72-00-61, Removal-32 (Task 72-00-61-050-014).

(3) Remove the EEC alternator stator. Refer to 72-00-61, Removal-10 (Task 72-00-61-050-007).

(4) Remove the EEC alternator rotor. Refer to 72-00-61, Removal-09 (Task 72-00-61-050-006).

NOTE: Removal of the oil tank is optional. To remove the oil tank, refer to 72-00-61, Removal-28 (Task 72-00-61-050-012).

B. Equipment And Materials Required

Special Tools:
P60041 Shipping Equipment Assembly

C. Procedure

See Figures 1201 and 1202.

(1) If applicable, remove the bolts that attach the cover of the container. Remove the cover.

(2) With a hoist and two slings, lift the detail support of P60041 Shipping Equipment Assembly. Attach the support to the main gearbox clevises with the detail ball lock pins.

(3) With the detail screws, attach the covers to the bores shown in the referenced figure. Install the plugs and and cap where shown.

NOTE: If the oil tank is installed, do not install the cover for that bore.

MAIN GEARBOX − STORAGE−01

(4) With the hoist and slings, lift the assembly. Lower the assembly into the detail frame. Attach the support to the detail frame with the detail washers, lockwashers, and screws.

(5) With the detail bolts, attach the cover of the container.

Task 72−61−00−540−001:

2. Unpack The Main Gearbox

A. Equipment And Materials Required − None

B. Procedure

See Figures 1201 and 1202.

(1) Before you remove the bolts that attach the cover of the container, release the pressure inside the container. Use the detail pressure relief valve.

(2) Remove the bolts that attach the cover of the container. Remove the cover.

(3) Remove the eight bolts and washers that attach the detail support to the detail frame of the shipping equipment assembly.

(4) With a hoist and two slings, lift the detail support and main gearbox out of the detail frame. Put the assembly on a pallet.

(5) Remove the detail covers and plugs from the main gearbox.

(6) Remove the three ball lock pins that attach the main gearbox to the detail support. Remove the detail support from the main gearbox.

(7) Attach the detail support to the detail frame. Remove the hoist and slings.

C. Postrequisites

(1) Install the EEC alternator rotor. Refer to 72−00−61, Installation−09 (Task 72−00−61−450−006).

(2) Install the EEC alternator stator. Refer to 72−00−61, Installation−10 (Task 72−00−61−450−007).

MAIN GEARBOX - STORAGE-01

(3) Install the lubrication and scavenge oil pump. Refer to 72-00-61, Installation-32 (Task 72-00-61-450-014).

(4) If the oil tank was removed, install the oil tank. Refer to 72-00-61, Installation-28 (Task 72-00-61-450-012).

(5) Install the main gearbox. Refer to 72-00-61, Installation-01 (Task 72-00-61-420-001) or Installation-33 Task 72-00-61-420-003).

MAIN GEARBOX - TESTING-01

Task 72-61-00-790-001:

1. Leak Check The Main Gearbox

A. Equipment And Materials Necessary

Special Tools:

CTE 5070	Cart, Airflow (Optional To CTE 6070)
CTE 6070	Cart, Airflow
PWA 85937	Cover (3 Necessary)
PWA 85938	Cover
PWA 85939	Cover
PWA 85940	Cover
PWA 85941	Cover
PWA 85942	Cover
PWA 85943	Cover
PWA 85944	Cover
PWA 85945	Cover
PWA 85946	Cover
PWA 85947	Cover
PWA 85948	Cover
PWA 85949	Cover
PWA 85951	Plug (Optional To Engine Part)
PWA 85953	Plug (Optional To Engine Part) (2 Places)
PWA 85954	Cover

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-007	Fluid, Leak Check (PMC 9569 Or PMC 2277)

B. Procedure

See Figure 1301.

CAUTION: DO NOT TURN THE GEARBOX TO PUT THE OIL TANK UNDER THE GEARBOX. TO DO SO WILL CAUSE DAMAGE TO THE OIL TANK.

CAUTION: DO NOT TRUNNION THE GEARBOX WITH THE LUBE OIL TANK INSTALLED. THERE IS INSUFFICIENT CLEARANCE UNDER THE STAND. DAMAGE TO THE OIL TANK WILL RESULT.

(1) Install the tools at locations shown in the referenced figure.

(a) For those tools with packings, lubricate the packings with Engine Oil P03-001 before you install the packings on the tools.

WARNING: BEFORE YOU DO THE CHECK, MAKE SURE THAT ALL COVERS AND PLUGS ARE TIGHTENED. IF THEY ARE NOT TIGHT, THEY CAN CAUSE INJURY DURING THE CHECK.

(2) Connect CTE 6070 Cart or CTE 5070 Cart to PWA 85939 Cover.

(3) Pressurize the main gearbox and oil tank at 10 psig (68.9 kPa).

(4) Apply Leak Check Fluid P05-007 all around the mating surfaces shown in the figure.

(5) No leaks are permitted. If there are leaks, examine the tightness of the bolts, the position of the housings and seals, etc. Correct them. Examine for leaks again. If there are still leaks, it is possible that repairs are necessary.

(6) Remove all leak check tools.

(a) Make sure that all detail nuts, washers, and bolts are stored with their covers.

(b) If tools (painted red) were installed in plug locations, remove them and replace with packings and plugs that are engine parts. See Assembly-03 (Task 72-61-00-790-001).

C. Postrequisites

(1) Install the EEC rotor and stator, the lubrication and scavenge oil pump, and the brackets on the main gearbox. Refer to Assembly-06 (Task 72-61-00-400-006).

Pratt & Whitney
PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

DEOILER GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-01-040-001:

1. Disassemble Deoiler Gearshaft And Bearings Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 12126	Base
PWA 85277	Drift
PWA 85279	Drift
PWA 85373	Wrench
PWA 85378	Holder
PWA 85384	Puller, Jackscrew
PWA 86345	Plate

B. Procedure

(1) Secure the PWA 85378 Holder in a vise. Position the spur gearshaft (501/5), spur gear end down, into the holder with the dowel pins in the holder engaged in the gearteeth. Using the PWA 85373 Wrench, remove the nut (501/11) from the gearshaft. Discard the nut. See Figure 501.

(2) Remove the spacer (501/10) and the deoiler impeller lock (501/9) from the gearshaft. Remove the deoiler impeller (501/8) from the gearshaft.

(3) Remove the deoiler impeller support (501/7) from the gearshaft using PWA 85384 Puller.

(a) Remove the retaining ring securing the jaws.

(b) Retract the jackscrew as required and install the base of the puller into the gearshaft.

(c) Position the puller jaws behind the shoulder of the impeller support and secure with the retaining ring.

(d) Using a standard wrench, turn the jackscrew to separate the support from the gearshaft.

(4) Carefully separate and remove the bearing housing (501/1) from the gearshaft, and place the housing, flange side down, on a bench.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(5) Remove the four bolts (501/3) securing the bearing outer race (501/2) to the bearing housing. Remove the outer race.

(6) Position the PWA 86345 Plate around and under the inner race of the bearing (501/6). Place the assembly, with gearshaft splined end down, into the PWA 12126 Base.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(7) Install the PWA 85277 Drift into the gearshaft. Using an arbor press, drift off the bearing inner race from the gearshaft.

(8) Place the bearing in a suitable labeled container.

(9) Remove the gearshaft from the base and position the split halves of the PWA 86345 Plate around and under the bearing inner race (501/3). Place the assembly, with large spur gear end down, into the base (PWA 12126).

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(10) Install the PWA 85279 Drift into the gearshaft. Using an arbor press, drift off the bearing inner race from the gearshaft. Remove the gearshaft and plate from the base.

(11) Place the bearing in a suitable labeled container.

DEOILER GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-01-440-001:

1. Assemble Deoiler Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Special Tools:
PWA 80130 Force Gage
PWA 85355 Drift
PWA 85356 Drift
PWA 85373 Wrench
PWA 85378 Holder
PWA 85856 Holder
PWA 85857 Drift

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Nut	1	72-61-00/10/130

C. Procedure

(1) Heat bearing inner race and rollers (1001/3) and (1001/6) per Standard Practices Manual, 70-00.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(2) Position spur gearshaft (1001/5), splined end down, on PWA 85856 Holder. Using arbor press, PWA 85356 Drift, and PWA 80130 Force Gage, install bearing inner race and rollers (1001/6) onto smaller ID end of gearshaft. Seat bearing using 1500 lb. (680.39 Kg) load.

(3) Position gearshaft, splined end up, on PWA 85856 Holder. Using arbor press, PWA 80130 Force Gage, and PWA 85355 Drift, install bearing inner race and rollers (1001/3) onto splined end of gearshaft. Seat bearing using 1500 lb. (680.39 Kg) load.

(4) Place bearing housing (1001/1), flanged end down, on bench. Align boltholes and install bearing outer race (1001/2) into bore in bearing housing. Secure outer race using four new bolts (1001/4) or bolts which have
R the antigalling compound replaced by SPOP 139 (Task
R 70−41−03−380−034). Refer to Section 70−41−03 in the
R Standard Practices Manual, PN 585005. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(5) Position gearshaft, splined end up, on suitable support. Position bearing housing (1001/1), flange side up, over gearshaft. Lower bearing housing onto gearshaft, mating bearing outer race with bearing rollers installed on gearshaft.

(6) Place the gearshaft, splined end up, on PWA 85856 Holder.

(7) Position deoiler impeller support (1001/7), flange seat facing up, over gearshaft. Use PWA 85857 Drift and an arbor press to seat the support on the bearing inner race.

(8) Position deoiler impeller (1001/8), slotted ID end up, over gearshaft. Seat impeller in retaining flange of support (1001/7). Do a dimensional check of the assembly to be sure that the deoiler impeller is correctly installed. Do the check at three locations that are at an equal distance from each other.

(9) Align splines and two lugs in deoiler impeller lock (1001/9) with splines on gearshaft and slots in ID of impeller (1001/8). Seat the lock on the gearshaft.

(10) Install spacer (1001/10) on gearshaft.

(11) Secure PWA 85378 Holder in vise. Position spur gearshaft (1001/5), spur gear end down, into holder with dowel pin details of holder engaged in gearteeth. Install a new nut (1001/11). Using PWA 85373 Wrench, torque nut to 1175 − 1250 lb−in. (133 − 141 N.m).

(12) Remove wrench and deoiler gearshaft assembly from holder.

GEARBOX DRIVE GEARSHAFT AND BEARINGS ASSEMBLY − DISASSEMBLY−01

Task 72−61−02−040−001:

1. Disassemble Gearbox Drive Gearshaft And Bearings Assembly

A. Equipment And Materials Necessary

Specials Tools:

PWA 12126	Base
PWA 85278	Drift
PWA 86345	Plate
PWA 88245	Drift

B. Procedure

(1) Install the split halves of the PWA 86345 Plate around and under the bearing inner race and rollers (501/3). Place the assembly, with smaller spur gear end down, into the PWA 12126 Base. See Figure 501.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN CONTAINER FOLLOWING REMOVAL.

(2) Install the PWA 88245 Drift into the gearshaft. Using an arbor press, drift off the bearing inner race from the gearshaft.

(3) Remove the gearshaft and install the split halves of the PWA 86345 Plate around and under the bearing inner race and rollers (501/1). Place the assembly, with large spur gear end down, into the base.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX DRIVESHAFT HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN CONTAINER FOLLOWING REMOVAL.

(4) Install the PWA 85278 Drift into the gearshaft. Using an arbor press, drift off the bearing inner race and rollers from the gearshaft.

(5) Remove the gearshaft from the base.

(6) Place the gearshaft and bearings in a suitable, labeled container.

GEARBOX DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-02-440-001:

1. Assemble Gearbox Drive Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:
PWA 80130 Force Gage
PWA 85350 Drift
PWA 85856 Holder
PWA 86164 Drift

C. Procedure

(1) Heat bearing inner races and rollers (1001/1 and 1001/3) per Standard Practices Manual, 70-00. See Figure 1001.

(2) Place gearbox spur gearshaft (1001/2), small spur gear end down, on PWA 85856 Holder.

CAUTION: KEEP ALL DETAILS OF THE PARTICULAR BEARING TOGETHER.

(3) Remove bearing inner race and rollers (1001/3) from heat source and install bearing onto gearshaft. Using PWA 86164 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 Kg) to seat bearing on gearshaft.

(4) Remove gearshaft and place it, large spur gear end down, on (PWA 85856) Holder.

CAUTION: KEEP ALL DETAILS OF THE PARTICULAR BEARING TOGETHER.

(5) Remove bearing inner race and rollers (1001/1) from heat source. Install bearing onto gearshaft. Using PWA 85350 Drift, and (PWA 80130) Force Gage, apply load of 1500 lb. (680.39 Kg) to seat bearing on gearshaft.

(6) Place the gearshaft and bearings assembly in a correct container with a label.

STARTER DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-03-040-001:

1. Disassemble Starter Drive Gearshaft And Bearings Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 12126	Base
PWA 26377	Holder
PWA 85279	Drift
PWA 85502	Puller
PWA 86345	Plate
PWA 102419	Drift

B. Procedure
See Figure 501.

(1) Install the starter drive gearshaft and bearings assembly, smaller spline gear down, onto a suitable support.

(2) Insert the spline drive of the PWA 26377 Holder into the internal splines of the coupling (501/4). Insert a standard wrench into the adapter detail of the holder to prevent rotation. Remove the nut (501/2) securing the coupling to the gearshaft. Remove the washer (501/3) or (501/3A) and coupling. If necessary remove the coupling using the PWA 85502 Puller. Insert the pin detail of the puller into the puller hole in the rear ID of the coupling and remove the coupling from the gearshaft.

(3) Position the split halves of the PWA 86345 Plate around and under the bearing inner race and rollers (501/6) at the smaller spur gear end of the gearshaft. Place the assembly, with larger spur gear end down, into the PWA 12126 Base.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(4) Using the PWA 85279 Drift and an arbor press, separate the gearshaft from the bearing. Place the bearing race and rollers in a container. Remove the gearshaft from the base.

(5) Position the split halves of the PWA 86345 Plate around and under the remaining bearing inner race and rollers (501/1) at the larger spur gear end of the gearshaft. Install the gearshaft and plate in the PWA 12126 Base.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(6) Using the PWA 102419 Drift and an arbor press, separate the gearshaft from the bearing. Place the bearing inner race and rollers in a container. Remove the gearshaft from the base.

STARTER DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-03-440-001:

1. Assemble Starter Drive Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-61-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Material Required

Special Tools:

PWA 26377	Holder
PWA 80130	Force Gage
PWA 85357	Drift
PWA 85358	Drift
PWA 85856	Holder

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-059	Lubricant, Fluorinated Grease (PWA 36230)

C. Procedure
See Figure 1001.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER GEARSHAFT. INTERCHANGEABILITY IS AFFECTED. REFER TO (SB PW4ENG 72-357).

CAUTION: BEFORE YOU APPLY FLUORINATED GREASE LUBRICANT TO THE STARTER DRIVE COUPLING, MAKE SURE THE STARTER DRIVE COUPLING SPLINES AND STARTER DRIVE GEARSHAFT SPLINES ARE CLEAN AND NOT DAMAGED. APPLY FLUORINATED GREASE LUBRICANT TO THE STARTER DRIVE COUPLING SPLINES TO REDUCE WEAR AND INCREASE SERVICE LIFE OF THE PARTS.

STARTER DRIVE GEARSHAFT AND BEARINGS ASSEMBLY − ASSEMBLY−01

(1) Install gearshaft (1001/5), smaller spur gear end down, on suitable support. Lubricate the ID and OD splines of the coupling with Fluorinated Grease Lubricant P06−059. Align the splines and install the coupling (1001/4), splined end down, into the gearshaft. Secure the coupling with the washer (1001/3) or (1001/3A) and the nut (1001/2) lubricated with Engine Oil P03−001.

(2) Insert splined drive of PWA 26377 Holder into internal splines of coupling. Insert standard wrench into adapter detail of holder to prevent rotation. Torque nut to 290 − 325 lb−in. (32.766 − 36.720 N.m). Remove holder.

(3) Heat bearing inner races and rollers (1001/1) and (1001/6) by 70−00, Standard Practices Manual, PN 585005.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(4) Place gearshaft on PWA 85856 Holder, smaller spur gear end down. Remove bearing inner race and rollers (1001/1) from heat source and position it over bearing journal of gearshaft. Using PWA 85358 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(5) Remove and invert the gearshaft on the holder. Remove bearing inner race and rollers (1001/6) from heat source and position it over bearing journal of gearshaft. Using PWA 85357 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft.

(6) Place gearshaft and bearing assembly in a correct container with a label.

FUEL PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-04-040-001:

1. Disassemble Fuel Pump Drive Gearshaft And Bearings Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 12126	Base
PWA 85282	Drift
PWA 85283	Drift
PWA 85444	Plate
PWA 86345	Plate

B. Procedure
See Figure 501.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(1) Position the split halves of the PWA 86345 Plate under the bearing inner race and rollers (501/3). Position the spur gearshaft (501/2), larger spur gear end down, into the PWA 12126 Base. Using the PWA 85283 Drift and an arbor press, separate the gearshaft from the bearing. Remove the gearshaft from the base. Place the bearing in a suitable, labeled container.

CAUTION: ALL DETAILS OF PARTICULAR MUST BEARING BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(2) Position detail jaws of the PWA 85444 Plate under the bearing inner race (501/1). Tighten th ecap screws to secure the jaws. Positon the assembly, with smaller spur gear end down, into the PWA 12126 Base. Install the PWA 85282 Drift into the gearshaft. Using an arbor press, separate the gearshaft from the bearing.

(3) Place the gearshaft and bearings in a suitable, labeled container.

FUEL PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-04-440-001:

1. Assemble Fuel Pump Drive Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:
PWA 80130 Force Gage
PWA 85269 Drift
PWA 85352 Drift
PWA 85856 Holder

C. Procedure

See Figure 1001.

(1) Heat bearing inner races and rollers (1001/1) and (1001/3) per Standard Practices Manual, 70-00.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(2) Place gearshaft (1001/2), smaller spur gear end down, on PWA 85856 Holder. Remove bearing inner race and rollers (1001/1) from heat source and position it over bearing journal of gearshaft. Using PWA 85352 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 Kg) to seat bearing on gearshaft.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(3) Remove and invert gearshaft on the holder. Remove bearing inner race and rollers (1001/3) from heat source and position it over bearing journal of gearshaft. Using PWA 85269 Drift and PWA 80130 Force Gage, apply

REAR HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-05-040-001:

1. Disassemble Rear Hydraulic Pump Drive Gearshaft And Bearings Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 12126	Base
PWA 85282	Drift
PWA 85283	Drift
PWA 86345	Plate

B. Procedure
See Figure 501.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(1) Position the split halves of the PWA 86345 Plate under the bearing inner race and rollers (501/3). Position the spur gearshaft (501/2), smaller OD end down, into the PWA 12126 Base. Using the PWA 85283 Drift and an arbor press, separate the gearshaft from the bearing.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN CONTAINER FOLLOWING REMOVAL.

(2) Reverse the gearshaft in the base positioning the halves of the plate under the bearing inner race and rollers (501/1). Using the PWA 85282 Drift and an arbor press, separate the gearshaft from the bearing.

(3) Place the gearshaft and bearings in a suitable, labeled container.

REAR HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-05-440-001:

1. Assemble Rear Hydraulic Pump Drive Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:
PWA 80130 Force Gage
PWA 85269 Drift
PWA 85345 Drift
PWA 85856 Holder

C. Procedure

See Figure 1001.

(1) Heat bearing inner races and rollers (1001/1) and (1001/3) per Standard Practices Manual, 70-00.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(2) Place gearshaft (1001/2), smaller ID end down, on PWA 85856 Holder. Remove bearing inner race and rollers (1001/3) from heat source and position it over bearing journal of gearshaft. Using PWA 85269 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(3) Turn gearshaft and place on (PWA 85856) Holder. Remove bearing inner race and rollers (1001/1) from heat source and position it over bearing journal of gearshaft.

Using PWA 85345 Drift and PWA 85130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft.

(4) Place gearshaft and bearing assembly in a correct container with a label.

IDG DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-06-040-001:

1. Disassemble IDG Drive Gearshaft And Bearings Assembly
   A. Equipment And Materials Required

      Special Tools:
      PWA 12126 Base
      PWA 85275 Drift, (Rear Bearing) Disassembly (Optional to PWA 85663 Drift)
      PWA 85276 Plate
      PWA 85277 Drift, (Front Bearing) Disassembly
      PWA 85663 Drift, (Rear Bearing) Disassembly

   B. Procedure
      See Figure 501.
      (1) Place PWA 12126 Base on workbench.
      (2) Position split halves of PWA 85276 Plate around and under bearing inner race and rollers (501/1). Position gearshaft, splined end down, into Base (PWA 12126), seating Plate (PWA 85276) in recess of base.
      (3) Using PWA 85275 or PWA 85663 Drift and arbor press, separate gearshaft from bearing. Remove drift.

      CAUTION: ALL DETAILS OF BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN CONTAINER FOLLOWING REMOVAL.

      (4) Place bearing in suitable labeled container.

      CAUTION: ALL DETAILS OF BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN CONTAINER FOLLOWING REMOVAL.

      (5) Reverse gearshaft in base, positioning halves of Plate (PWA 85276) around and under inner race and rollers (501/3). Using PWA 85277 Drift and arbor press, separate gearshaft from bearing.

IDG DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-06-440-001:

1. Assemble IDG Drive Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:
PWA 80130 Force Gage
PWA 85353 Drift, (Front Bearing) Assembly
PWA 85354 Drift, (Rear Bearing) Assembly
PWA 85856 Holder
PWA 85664 Drift, (Rear Bearing) Assembly

C. Procedure

See Figure 1001.

(1) Heat bearing inner races and rollers (1001/1) and (1001/3) per Standard Practices Manual, 70-00.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(2) Place gearshaft (1001/2), spur gear end down, on PWA 85856 Holder. Remove bearing inner race and rollers (1001/1) from heat source and position it over bearing journal of gearshaft. Using PWA 85354 or PWA 85664 Drift and PWA 81030 Force Gage, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(3) Turn the gearshaft. Place it on the holder. Remove bearing inner race and rollers (1001/3) from heat source and position it over bearing journal of gearshaft. Using PWA 85353 Drift and PWA 80130 Force Gage, apply

load of 1500 lb. (680.39 kg) to seat bearing on gearshaft.

(4) Place gearshaft and bearings assembly in a correct container with a label.

FRONT HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-07-040-001:

1. Disassemble Front Hydraulic Pump Drive Gearshaft And Bearing Assembly

A. Equipment And Materials Required

Special Tools:
PWA 12126 Base
PWA 85204 Puller (Optional to PWA 88110)
PWA 85282 Drift
PWA 85374 Wrench
PWA 85379 Holder
PWA 86345 Plate, Disassembly
PWA 88110 Puller

B. Procedure

See Figures 501 and 502.

(1) Remove retaining ring (501/13) securing face (oil) seal (501/12) to bearing support (501/10). Using either PWA 88110 or PWA 85204 Puller, remove seal from support. Discard packing (501/11).

(2) Remove lockwire, oil metering plug (501/1) and insert (501/13) from boss in inside rear wall of bearing housing. Discard packings (501/12) and (501/14).

(3) Remove lockwire, plug (501/9), and bushing (501/7) from port in bottom of bearing housing. Discard packings (501/8) and (501/6).

(4) Secure PWA 85379 Holder in vise. Place gearshaft/bearing support assembly, spur gear end down, into PWA 85379 Holder, with dowel pins in holder engaged in gear teeth. Using PWA 85374 Wrench, remove nut (502/12) from gearshaft. Discard the nut (502/12).

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN BEARING SUPPORT. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(5) Place split halves of PWA 86345 Plate under bearing outer race (502/7). Position gearshaft and bearings assembly, gear end down, into PWA 12126 Base. Using PWA 85282 Drift and arbor press, push gearshaft out of bearing. Remove bearing inner race and rollers (502/11).

(6) Remove four bolts (502/1) and nuts (502/3) securing bearing outer race (502/10) to bearing support. Remove bearing outer race.

(7) Place bearing in suitable, labeled container.

(8) Remove front hydraulic pump drive bearing sleeve spacer (502/4).

(9) Carefully separate and remove bearing support (502/2) from spur gearshaft (502/5) ensuring that gearshaft will not suddenly drop out of bearing outer race.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN BEARING SUPPORT. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

(10) Move bearing inner race and rollers (502/8) to outer bearing journal on gearshaft. Reposition split halves of PWA 86345 Plate under bearing inner race and rollers. Position gearshaft, spur gear end down, into (PWA 12126) Base. Using (PWA 85282) Drift and arbor press, push gearshaft out of bearing. Remove bearing and gearshaft from base.

(11) Remove four bolts (502/6) and nuts (502/9) securing bearing outer race (502/7) to bearing support (502/2). Remove outer race.

(12) Place bearings in suitable, labeled container.

FRONT HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-07-440-001:

1. Assemble Front Hydraulic Pump Drive Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(Task 72-61-07-440-001)

FRONT HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY − ASSEMBLY−01

CAUTION: KEEP ALL DETAILS OF A PARTICULAR BEARING TOGETHER.

(2) Place spur gearshaft (1001/5), spur gear end down, on PWA 85856 Holder. Remove inner race and rollers (1001/8) from heat source and place on lower bearing journal of gearshaft. Using PWA 86017 Spacer, PWA 85345 Drift, PWA 80130 Force Gage, and arbor press, apply load of 1500 lbf. (6672.3 N) to seat bearing on gearshaft.

(3) Align boltholes and install mating bearing outer race (1001/7) onto flange of bearing support (1001/2). Lubricate four bolts (1001/6) with Engine Oil (P03−001). Secure the outer race with the four bolts and nuts (1001/9). Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(4) Carefully install bearing support (1001/2) over gearshaft, mating bearing rollers on gearshaft with outer race installed on bearing support.

(5) Install sleeve spacer (1001/4) over gearshaft and seat on previously installed bearing inner race.

CAUTION: KEEP ALL DETAILS OF A PARTICULAR BEARING TOGETHER.

(6) Align boltholes and install bearing outer race (1001/10) into bore in bearing support. Lubricate four bolts (1001/1) with Engine Oil (P03−001). Secure the outer race with the four bolts and nuts (1001/3). Torque bolts to 85 − 90 lb−in. (9.604 − 10.734 N.m).

(7) Remove bearing inner race and rollers (1001/11) from heat source. Install bearing on bearing journal of gearshaft, mating bearing rollers with bearing outer race installed in bearing support. Position PWA 85345 Drift over bearing inner race. Using (PWA 80130) Force Gage and arbor press, apply load of 1500 lbf (6672.3 N) to seat bearing on gearshaft. Remove tools.

(8) Install new nut (1002/12) on gearshaft to secure bearing. Tighten nut fingertight.

FRONT HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY − ASSEMBLY−01

(9) (Reference 1120) Secure PWA 85379 Holder in vise. Place gearshaft/bearing support assembly, spur gear end down, into PWA 85379 Holder, with dowel pins in holder engaged in gearteeth. Using PWA 85374 Wrench, torque nut (1001/12) to 1500 − 1700 lb−in. (169.477 − 192.074 N.m). Loosen nut to 0 lb−in. (0 N.m). Retorque nut to 1500 − 1700 lb−in. (169.477 − 192.074 N.m).

(10) Install new packing (1002/4) lubricated with Engine Oil (P03−001), onto insert (1002/3). Install insert, lubricated with Engine Oil (P03−001), into port in rear wall of bearing housing (1002/5). Torque insert to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(11) Install new packing (1002/2) lubricated with Engine Oil (P03−001), onto oil metering plug (1002/1). Install plug, lubricated with Engine Oil (P03−001), into previously installed insert (1002/3). Torque plug to 40 − 50 lb−in. (4.519 − 5.649 N.m). Lockwire the plug.

(12) Install new packing (1002/11), lubricated with Engine Oil (P03−001), into groove in OD of face (oil) seal (1002/12). Carefully install seal into bore in bearing support (1002/10). Secure seal with retaining ring (1002/13).

(13) Install new packing (1002/6), lubricated with Engine Oil (P03−001), onto bushing (1002/7). Install bushing, lubricated with Engine Oil (P03−001), into port in bottom OD of bearing housing. Torque bushing to 250 − 275 lb−in. (28.246 − 31.071 N.m).

(14) Install new packing (1002/8), lubricated with Engine Oil (P03−001), onto plug (1002/9). Install plug, lubricated with Engine Oil (P03−001), into previously installed bushing (1002/7). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Lockwire plug.

SCAVENGE PUMP DRIVE GEARSHAFT AND BEARING ASSEMBLY - DISASSEMBLY-01

Task 72-61-08-040-001-002:

1. Disassemble Scavenge Pump Drive Gearshaft And Bearing Assembly (Pre SB PW4ENG 72-114 And Post SB PW4ENG 72-463)

   A. Equipment And Materials Required

      Special Tools:
      PWA 12126 Base
      PWA 85272 Drift
      PWA 85274 Plate
      PWA 85372 Wrench
      PWA 85377 Holder (Optional To PWA 88642)
      PWA 88642 Holder

   B. Procedure
      See Figure 501.

      CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER AS A SET.

      (1) Secure PWA 88642 or PWA 85377 Holder in vise. Position scavenge pump spur gearshaft and bearing assembly, spur gear end down, onto holder, with dowel pins of holder through holes in spur gear. Using PWA 85372 Wrench, remove nut (501/3) from scavenge pump drive gearshaft (501/1). Remove gearshaft from holder. Discard the nut (501/3).
      (2) Place split halves of PWA 85274 Plate around and under bearing (501/2). Position gearshaft, gear end down, into PWA 12126 Base.

      NOTE: Use PWA 85274 Plate, Change Letter A, with a gearshaft that is (Pre SB PW4ENG 72-114). Use PWA 85274 Plate, Change Letter B, with a gearshaft that is (Post SB PW4ENG 72-463).

      (3) Insert pin detail of PWA 85272 Drift into gearshaft. Using arbor press, drift off bearing from gearshaft.
      (4) Place gearshaft and bearing in suitable, labeled container.

SCAVENGE PUMP DRIVE GEARSHAFT AND BEARING ASSEMBLY − DISASSEMBLY−01

Task 72−61−08−040−001−001:

2. Disassemble Scavenge Pump Drive Gearshaft And Bearing Inner Race Assembly (Post SB PW4ENG 72−114)

A. Equipment And Materials Required

Special Tools:
PWA 12126 Base
PWA 85272 Drift
PWA 85274 Plate

B. Procedure
See Figure 502.

CAUTION: ALL DETAILS OF A PARTICULAR BEARING MUST BE KEPT TOGETHER AS A SET.

(1) Place split halves of PWA 85274 Plate, Change Letter B, around and under bearing inner race (502/2). Position gearshaft (502/1) gear end down, into PWA 12126 Base.
(2) Insert pin detail of PWA 85272 Drift into gearshaft. Using arbor press, drift off bearing inner race from gearshaft.
(3) Place gearshaft and all details of bearing assembly in suitable, labeled container.

(Task 72-61-08-040-001-001)

Task 72-61-08-440-001-002:

1. Assemble Scavenge Pump Drive Gearshaft And Bearing Assembly (Pre SB PW4ENG 72-114)

A. Prerequisites

(1) See Inspection/Check-04 Task 72-61-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Special Tools:

PWA 80130	Gage, Force
PWA 85267	Base (Optional To PWA 88683)
PWA 85349	Drift
PWA 85372	Wrench
PWA 85377	Holder (Optional To PWA 88642)
PWA 88642	Holder
PWA 88683	Base

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Nut	1	72-61-00/8/30

C. Procedure
See Figure 1001.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED.

CAUTION: IT IS VERY IMPORTANT THAT YOU FOLLOW THE STEPS IN THE SEQUENCE SHOWN IN THE FIGURES. YOU MUST INSTALL THE BEARING ON THE SHAFT AND TORQUE THE BEARING RETAINING NUT ON THE BENCH. IF YOU DO NOT OBEY THE INSTRUCTIONS OR ASSEMBLY AND TORQUE THE RETAINING NUT WHILE IN A GEARBOX, AN IN-FLIGHT-SHUTDOWN CAN OCCUR.

(1) Heat bearing inner race (1001/2) by Chapter/Section 70-00 of the Standard Practices Manual, PN 585005.

(2) Place scavenge pump spur gearshaft (1001/1), spur gear end down, into PWA 85267 or PWA 88683 Base.

(3) Install bearing ring (1001/2) on gearshaft to seat against shoulder of gearshaft.

NOTE: The ring is a detail of the bearing inner race.

(4) Install bearing outer race and rollers (1001/3) on gearshaft, mating number down.

(5) Remove bearing inner race from heat source. Using PWA 85349 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat inner race on gearshaft. Remove drift and force gage.

(6) Install new nut (1001/5) on gearshaft to secure bearing. Tighten nut fingertight.

(7) Secure PWA 88642 Holder or PWA 85377 Holder in vise. Position scavenge pump spur gearshaft and bearing assembly, spur gear end down, onto holder with dowel pins of holder through holes in spur gear. Using PWA 85372 Wrench, torque nut to 500 - 600 lb-in. (57 - 68 N.m).

(8) Place gearshaft and bearing in suitable container.

Task 72-61-08-440-001-001:

2. Assemble Scavenge Pump Drive Gearshaft And Bearing Inner Race Assembly (Post SB PW4ENG 72-114)

A. Prerequisites

(1) See Inspection/Check-04 Task 72-61-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

See Figure 1003.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED.

CAUTION: IT IS VERY IMPORTANT THAT YOU FOLLOW THE STEPS IN THE SEQUENCE SHOWN IN THE FIGURES. YOU MUST INSTALL THE BEARING ON THE SHAFT AND TORQUE THE BEARING RETAINING NUT ON THE BENCH. IF YOU DO NOT OBEY THE INSTRUCTIONS OR ASSEMBLY AND TORQUE THE RETAINING NUT WHILE IN A GEARBOX, AN IN−FLIGHT−SHUTDOWN CAN OCCUR.

(1) Heat bearing inner race (1003/2) by Chapter/Section 70−00 of the Standard Practices Manual, PN 585005.

(2) Place scavenge pump spur gearshaft (1003/1), spur gear end down, into PWA 85267 or PWA 88683 Base.

(3) Remove bearing inner race from heat source. Using PWA 85349 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat inner race, flange side down, on gearshaft. Remove drift and force gage.

(4) Install bearing outer race and rollers (1003/3) on gearshaft, mating numbers down.

(5) Install bearing ring (1003/4) on gearshaft to seat against roller.

NOTE: The ring is a detail of the bearing inner race.

SCAVENGE PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY − ASSEMBLY−01

(6) Apply Engine Oil P03−001 to the threads of the new nut (1003/5). Install the nut on gearshaft to secure bearing. Tighten nut fingertight.

(7) Secure PWA 88642 Holder or PWA 85377 Holder in vise. Position scavenge pump spur gearshaft and bearing assembly, spur gear end down, onto holder with dowel pins of holder through holes in spur gear. Using PWA 85372 Wrench, torque nut to 500 − 600 lb−in. (57 − 68 N.m).

(8) Place gearshaft and bearing in suitable container.

EEC/PMA ALTERNATOR DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-09-040-001:

1. Disassemble EEC/PMA Alternator Drive Gearshaft And Bearings Assembly

A. Equipment And Materials Required

Special Tools:
PWA 12126 Base
PWA 85273 Drift
PWA 85274 Plate
PWA 85723 Puller
PWA 86086 Puller

B. Procedure

See Figure 501.

(1) Remove retaining ring (501/13) securing face (oil) seal (501/12) to generator housing (501/3). Using PWA 85723 Puller, remove seal from housing. Discard packing (501/11).

(2) Remove EEC/PMA Alternator rotor sleeve spacer (501/10). Discard packing (501/9) from gearshaft.

(3) Remove bearing seal seat (501/1) with PWA 86086 Puller.

(4) For engines that have not incorporated SB PW4ENG 72-206:

  (a) Remove two bolts (501/19) securing bearing outer race (501/18) to generator housing.

(5) For engines that have incorporated SB PW4ENG 72-206:

  (a) Remove the bolt (501/19) that attaches the bearing outer race (501/18) to the generator housing.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(6) Place split halves of PWA 85274 Plate under mounting flange of housing (501/3). Position gearshaft and bearings assembly, gear end down, into PWA 12126 Base. Using PWA 85273 Drift and arbor press, push gearshaft out of bearing. Remove bearing inner race and rollers (501/2). Remove bearing outer race (501/18) from housing. Place bearing in suitable labeled container.

EEC/PMA ALTERNATOR DRIVE GEARSHAFT AND BEARINGS ASSEMBLY − DISASSEMBLY−01

(7) Carefully separate and remove generator housing (501/3) from spur gearshaft (501/7) ensuring that gearshaft will not suddenly drop out of its bearing outer race. Remove gearshaft and bearing inner race from base. Remove bearing spacer (501/4) from gearshaft.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(8) Place split halves of PWA 85274 Plate under bearing inner race and rollers (501/6). Position spur gearshaft (501/7), gear end down, into PWA 12126 Base. Using PWA 85273 Drift and arbor press, push gearshaft out of bearing.

(9) Remove two bolts (501/8) securing bearing (501/5) outer race to gearshaft housing. Remove bearing outer race.

(10) Place gearshaft and bearings in suitable, labeled container.

(11) Remove lockwire, plug (501/17), and insert (501/15) from port on bottom of generator housing (501/3). Discard packings (501/14) and (501/16).

EEC/PMA ALTERNATOR DRIVE GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-09-440-001:

1. Assemble EEC/PMA Alternator Drive Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 Task 72-61-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 80130	Gage, Force
PWA 85267	Base (Optional To PWA 88683)
PWA 85348	Drift, Assembly
PWA 86087	Drift, Hand
PWA 88683	Base

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-61-00/4/80
Packing	1	72-61-00/4/140
Packing	1	72-61-00/4/200
Packing	1	72-61-00/4/220
Lockwire, AS3214-02		

C. Procedure
See Figure 1001.

(1) Heat bearing inner race and rollers (1001/2) and (1001/6) per Standard Practices Manual, PN 585005, 70-00.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(2) Place gearshaft (1001/7), spur gear end down, into PWA 85267 Base or PWA 88683 Base. Remove inner race and rollers detail of bearing (1001/6) from heat source and place on lower bearing journal of gearshaft. Using PWA 85348 Drift, PWA 80130 Force Gage and arbor press, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft. Remove drift.

(3) Align boltholes and install mating bearing outer race (1001/5) into generator housing (1001/3). Secure outer race with two bolts (1001/8). Torque bolts to 27 − 30 lb−in. (3.051 − 3.390 N.m).

(4) Carefully install gearshaft into generator housing, mating bearing rollers with outer race installed in housing.

(5) Install bearing spacer (1001/4) over gearshaft and seat on bearing inner race.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER.

(6) Install the bearing outer race and retaining bolt(s) as follows:

(a) Align the boltholes and install the bearing outer race (1001/18) into the generator housing.

(b) Secure the outer race with bolt(s) (1001/19). Torque the bolt(s) to 27 − 30 lb−in. (3.051 − 3.390 N.m).

NOTE: For Pre SB PW4ENG 72−206 engines, use two bolts (1001/19). For Post SB PW4ENG 72−206 and Pre SB PW4ENG 72−375 engines, use one bolt (1001/19). For Post SB PW4ENG 72−375 engines, use two bolts (1001/19).

(7) Remove bearing inner race and rollers (1001/2) from heat source. Install bearing on bearing journal of gearshaft, mating bearing rollers with outer race installed in generator housing. Using PWA 85348 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft

EEC/PMA ALTERNATOR DRIVE GEARSHAFT AND BEARINGS ASSEMBLY − ASSEMBLY−01

CAUTION: TO AVOID THE INCORRECT INSTALLATION OF THE BEARING SEAL SEAT (1001/1) ON THE GEARSHAFT, THE SMALLER RADIAL SURFACE OF THE SEAL SEAT SHOULD TOUCH THE BEARING INNER RACE (1001/2). SEE Figure 1002.

(8) Position bearing seal seat (1001/1) over gearshaft and seat on bearing inner race. If necessary, use PWA 86087 Drift.

(9) Install new packing (1001/9), lubricated with Engine Oil P03−001, onto groove on gearshaft.

(10) Install EEC/PMA alternator rotor sleeve spacer (1001/10) over gearshaft and seat on bearing seal seat. If necessary, use PWA 86087 Drift.

(11) Install new packing (1001/11), lubricated with Engine Oil P03−001, into groove in face (oil) seal (1001/12). Carefully install carbon seal sealing face down over gearshaft and into bore in generator housing. Secure seal in housing with retaining ring (1001/13).

(12) Install new packing (1001/14) lubricated with Engine Oil P03−001, onto insert (1001/15). Install insert lubricated with Engine Oil P03−001, into port in OD of generator housing. Torque insert to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(13) Install new packing (1001/16) lubricated with Engine Oil P03−001, onto plug (1001/17). Install plug lubricated with Engine Oil P03−001, into previously installed insert in OD of generator housing. Torque plug to 65 − 75 lb−in. (7.344 − 8.474 N.m). Lockwire plug.

1. Assemble Scavenge Pump Drive Idler Gearshaft And Bearings Assembly

NOTE: This Section Has Been Relocated To 72-61-40

SCAVENGE PUMP DRIVE IDLER GEARSHAFT AND BEARINGS ASSEMBLY - DISASSEMBLY-01

Task 72-61-40-040-001:

1. Disassemble Scavenge Pump Drive Idler Gearshaft And Bearings Assembly

   A. Equipment And Materials Required

      Special Tools:
      PWA 12126 Base
      PWA 85270 Drift
      PWA 85271 Drift
      PWA 85274 Plate

   B. Procedure
      See Figure 501.

      CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

      (1) Place split halves of PWA 85274 Plate under bearing inner race and rollers (501/1). For gearshafts that are pre SB PW4ENG 72-114, use plate, Change Letter A. For gearshafts that are post SB PW4ENG 72-114, use plate, Change Letter B. Position spur gearshaft (501/2), smaller spur gear end down, into PWA 12126 Base. Using PWA 85270 Drift and arbor press, push gearshaft out of bearing.

      CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING IS INSTALLED IN GEARBOX HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER IN A CONTAINER FOLLOWING REMOVAL.

      (2) Reverse gearshaft in base, positioning halves of Plate (PWA 85274) under inner race and rollers (501/3). Using PWA 85271 Drift and arbor press, push gearshaft out of bearing.
      (3) Place gearshaft and bearings in suitable, labeled container.

SCAVENGE PUMP DRIVE IDLER GEARSHAFT AND BEARINGS ASSEMBLY - ASSEMBLY-01

Task 72-61-40-440-001:

1. Assemble Scavenge Pump Drive Idler Gearshaft And Bearings Assembly

A. Prerequisites

(1) See Inspection/Check-04 (Task 72-61-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:
PWA 80130 Gage, Force
PWA 85359 Drift
PWA 85360 Drift
PWA 85856 Holder

C. Procedure

See Figure 1001.

(1) Heat bearing inner races and rollers (1001/1) and (1001/3) per Standard Practices Manual, 70-00.

CAUTION: ALL DETAILS OF PARTICULAR BEARING MUST BE KEPT TOGETHER. OUTER RACE OF THIS BEARING WILL BE INSTALLED IN GEARBOX BEARING HOUSING. MAKE CERTAIN THAT ALL DETAILS ARE KEPT TOGETHER.

(2) Place gearshaft (1001/2), smaller spur gear end down, on PWA 85856 Holder. Remove bearing inner race and rollers (1001/1) from heat source and position it over bearing journal of gearshaft. Using PWA 85359 Drift and PWA 80130 Force Gage, apply load of 1500 lb. (680.39 kg) to seat bearing on gearshaft.

OIL CHECK VALVE ASSEMBLY - DISASSEMBLY-01

Task 72-61-71-040-001:

1. Disassemble Oil Check Valve Assembly

   A. Equipment And Materials Required - None

   B. Procedure

      See Figure 501.

      (1) Unscrew nut (501/6) and remove from valve (501/1).

      (2) Remove washer (501/5), spring seat (501/4), and spring (501/3).

      (3) Push valve (501/1) out of valve seat (501/2).

OIL CHECK VALVE ASSEMBLY - ASSEMBLY-01

Task 72-61-71-440-001:

1. Assemble Oil Check Valve Assembly

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure

See Figure 1001.

(1) Install valve (1001/5) in valve seat (1001/2).

(2) Install spring (1001/3) over valve stem.

(3) Install spring seat (1001/4) in spring.

(4) Install washer (1001/5) over valve stem.

(5) Lubricate threads of valve stem with Engine Oil (P03-001).

(6) For assemblies that are pre SB PW4ENG 79-43, install nut (1001/6) on valve stem and torque to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(7) For assemblies that are post SB PW4ENG 79-43, install the nut (1001/6) on the valve stem and torque to 36 - 40 lb-in. (4.067 - 4.519 N.m).

ANGLE GEARBOX - HOW TO USE MANUAL

Task 72-62-00-990-003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant angle gearbox parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED - This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED - This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

ANGLE GEARBOX - DESCRIPTION AND OPERATION

Task 72-62-00-990-002:

1. General

See Figures 1 and 2.

A. The angle gearbox transmits the power from the engine rotor to the main gearbox and from the starter on the main gearbox to the engine rotor. The angle gearbox housing is a cast aluminum housing that contains a bevel gear set that transmits the power from the towershaft to the layshaft. The general lubrication of the gears and bearings is accomplished by oil splash and by pressure oil supplied through three jets directed at the bearings and splines.

B. The angle gearbox is located between the intermediate case OD wall and the fan exit guide vane ID attachment at the bottom of the intermediate case.

C. The angle gearbox oil scavenge pump is located in the main oil/scavenge pump module mounted at the bottom rear of the main gearbox housing.

PWA 102112	Cradle, Support
PWA 102113	Puller, Jacscrew
PWA 102114	Pusher, Jackscrew

B. Procedure
See Figure 501.

Subtask 72-62-00-030-051:

(1) Remove two bolts securing angle gearbox (front Oil) nozzle assembly. Remove two bolts securing angle gearbox (rear oil) nozzle assembly. Carefully remove transfer tube and nozzles.

R NOTE: If the angle gearbox is the source of the metal in the system and there are pieces larger than a flake (such as a geartooth, washer, bolt, bearing part, etc.) then all liberated angle gearbox pieces larger than a flake must be found. If there are pieces larger than a flake that are not found, then the main gearbox must also be removed and disassembled sufficiently until the missing pieces are found. Refer to Section 72-00-00, Inspection/Check-04 (Task 72-00-00-280-054) for the definition of a flake.

ANGLE GEARBOX − DISASSEMBLY−01

R NOTE: If necessary, a Pratt & Whitney recommended
R cleaner to flush the gearbox can be found in
R Section 72−61−00, Cleaning−01 of the PW4000
R Series CIR, PN 51A357.

(2) Remove transfer tube from nozzles. Discard all packings.

(3) Remove bolt securing angle gearbox (coupling oil) nozzle adjacent to coupling. Remove nozzle and discard packing.

(4) Remove four bolts and washers securing angle gearbox cover assembly. Remove cover assembly. Discard packing.

(5) If necessary, remove the plug that is installed in the angle gearbox housing, approximately 180 degrees from the oil nozzle assembly.

(6) Remove the three bolts and washers (Pre SB PW4ENG 75−45 engines) or bracket (Post SB PW4ENG 75−45 engines) that attach the cover to the housing. Remove the cover and discard the packing.

Subtask 72−62−00−490−001:

(7) Prepare the support cradle for the removal of the cover assembly as follows.

- (a) Attach the PWA 102112 Support Cradle to the work bench.
- (b) Put the angle gearbox assembly on the support cradle with the mount lugs in the arms of the cradle.
- (c) If necessary, install the detail−2 plate to the base of the cradle and attach it with the detail screw and knob assembly.

Subtask 72−62−00−030−056:

(8) Remove the angle gearbox cover assembly as follows.

- (a) Remove the four bolts and washers that attach the angle gearbox cover assembly.

(b) Move the three detail jaws of the PWA 102113 Jackscrew Puller towards the center of the plate and tighten the knobs to hold the jaws in position.

(c) Install the three detail jaws of the puller in the opening of the angle gearbox cover assembly with the jackscrew in the slot of the detail−2 plate attached to the base of the cradle. Move the three detail jaws outward to engage the inner surface of the cover assembly. Tighten the knobs to lock the jaws in position.

(d) Turn the detail jackscrew of the puller with a wrench to remove the cover assembly. Remove the cover assembly from the jackscrew puller.

1 Remove and discard the packing from the groove of the cover assembly.

(e) If necessary, remove the detail−2 plate from the base of the cradle and attach it with the detail screw to the storage location on the base.

Subtask 72−62−00−030−052:

(9) Cut the lockwire and remove six bolts and washers securing the gearbox driveshaft housing assembly to the angle gearbox housing assembly. Put the angle gearbox on a work bench.

(a) Lower the PWA 102114 Pusher onto the gearbox so that the two detail "V" blocks are positioned on the two large pins that protude from the gearbox. If necessary, turn the detail jackscrew by hand so the detail ring will fit behind the flange of the housing. Make sure the two detail pins in the ring fit into the holes in the housing flange.

(b) Use a standard wrench to turn the detail jackscrew and dissassemble the two angle gearbox housings from one another.

(c) Separate the two assemblies and remove the PWA 102114 Pusher.

(d) Discard the packings.

ANGLE GEARBOX − DISASSEMBLY−01

Subtask 72−62−00−030−053:

(10) Install driveshaft housing in PWA 85413 Base bevel gear down.

(11) Unbend key washer. Install PWA 85414 Wrench with breaker bar to nut securing coupling on driveshaft. Loosen and remove nut and washer. Discard washer. Remove coupling.

(12) Install PWA 85415 Puller to grooves on ball bearing inner race. Remove inner race. Remove housing from driveshaft. Reinstall puller and remove remaining half of inner race. If necessary, use puller to remove spacer.

(13) Place two halves of PWA 85416 Plate under roller bearing inner race. Place driveshaft and plates on PWA 85443 Base. Using PWA 85422 Drift and arbor press remove shaft from bearing inner race.

(14) Unbend key washer tab and remove four bolts securing outer race and balls to housing. Remove outer race and balls. Discard key washers.

(15) Trunnion housing. Unbend key washer tabs, remove four bolts securing outer race (roller bearing) to housing. Remove outer race from housing. Discard key washers.

Subtask 72−62−00−030−054:

(16) Position angle gearbox housing assembly bottom end up. Unbend key washer tabs and remove three bolts securing bevel gear assembly to housing. Remove gear assembly. Discard key washer.

(17) Attach PWA 21500 Adapter to a workbench. Attach PWA 85417 Base to the adapter.

(18) Install gear assembly onto the base. Unbend key washer. Install PWA 85418 Wrench to retaining nut. Loosen and remove nut and washer. Discard washer.

(19) Install PWA 85419 Puller to inner race. Remove inner race. Remove outer race and balls. Reinstall puller to remove lower inner race. Remove spacer. Remove gear from base.

ANGLE GEARBOX − DISASSEMBLY−01

(20) Place two halves of PWA 85420 Plate under roller bearing inner race. Place shaft and plates on PWA 12126 Base. Using PWA 85421 Drift and arbor press, remove shaft from bearing inner race.

Subtask 72−62−00−030−055:

(21) Unbend key washer tabs and remove four bolts securing bearing to angle gearbox cover assembly. Lift off baffle from bearing retaining flange. Remove bearing from cover. Discard key washers.

(22) Remove bolts and washers securing cover to cover assembly. Remove cover and discard packing.

ANGLE GEARBOX − INSPECTION/CHECK−01

Task 72−62−00−990−004:

1. General Inspection Requirements − Angle Gearbox

   A. Organization Of Individual Part Or Subassembly Inspection Data

      (1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check−00 for part/subassembly. Section designations and function descriptions are as follows.

      (2) Inspection/Check−00 section contains, where applicable:

         (a) Part number(s) for which the inspection data is applicable.

         (b) Service Bulletin numbers applicable to part number(s).

         (c) Inspection/Check numbers, data categories and applicability data.

      (3) Inspection/Check−01, Preinspection Preparation, contains, where applicable:

         (a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

         (b) Identification of mechanical disassembly required prior to inspection.

         (c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

         (d) Identification of part/subassembly cleaning required prior to inspection.

      (4) Inspection/Check−02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

         (a) Fluorescent Penetrant Method

         (b) Eddy Current Method

  - (c) Magnetic Particle Method
  - (d) X−ray Method
  - (e) Ultrasonic Method
  - (f) Hardness Check
  - (g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

  - (a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

    NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

  - (b) Allowable blending for visual damage, which may be accomplished within the inspection area.

    NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

  - (a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

  - (a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/ subassembly to serviceable condition. References include the following, as required.

  - (a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−62−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−62−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

ANGLE GEARBOX − INSPECTION/CHECK−01

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

  (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

  (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

ANGLE GEARBOX − INSPECTION/CHECK−03

Task 72−62−00−990−005:

1. Visual Inspection − Angle Gearbox
   A. For inspection requirements applicable to installed (accessible) parts of Angle Gearbox see 72−00−62, Inspection/Check−02 (Task 72−00−62−210−001).

Previous Pageblock Return to Previous Menu Next Pageblock

ANGLE GEARBOX − INSPECTION/CHECK−04

Task 72−62−00−990−006:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

C. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

D. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

E. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

F. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

ANGLE GEARBOX - ASSEMBLY-01

Task 72-62-00-400-001:

1. Assemble Angle Gearbox Assembly

A. Prerequisites

(1) Assemble cover, bearing and baffle. See Assembly-03 Task 72-62-00-400-003.

(2) Assemble angle gearbox bevel gearshaft assembly and gearbox driveshaft housing assembly. See Assembly-04 Task 72-62-00-400-004.

(3) Assemble angle gearbox bevel gear assembly and angle gearbox housing assembly. See Assembly-05 Task 72-62-00-400-005.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85448	Fixture, Backlash
PWA 88697	Fixture, Backlash
PWA 102112	Cradle Support

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Anti-Seize (PWA 36246)
P09-016	Compound, Anaerobic Retaining (PWA 549-2)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-62-00/5/1
Packing	1	72-62-00/5/60
Packing	2	72-62-00/5/100
Packing	1	72-62-00/5/130
Packing	1	72-62-00/5/170
Packing	1	72-62-00/5/180

C. Procedure
See Figure 1001 and Figure 1002.

Subtask 72-62-00-430-058:

(1) Assemble the angle gearbox housing assembly to the gearbox driveshaft housing assembly with six bolts, threads lubricated with Anti-Seize Paste P06-054 and washers. Remove the unwanted paste. Tighten and torque bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(2) Assemble cover with baffle and bearing to bottom of gearbox housing assembly. Secure cover with four bolts, threads lubricated with Anti-Seize Paste P06-054 and washers. Remove the unwanted paste. Tighten and torque bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m).

Subtask 72-62-00-430-059:

(3) Install packing lubricated with Engine Oil P03-001, to groove on angle gearbox (coupling oil) nozzle.

(4) Insert nozzle into coupling end of gearbox and secure with bolt, threads lubricated with Anti-Seize Paste P06-054. Remove the unwanted paste. Tighten and torque bolt to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(5) If necessary, apply Retaining Compound P09-016 to the threads of the plug. Install the plug to the angle gearbox housing as shown in Figure 1001 (Sheet 2). Torque the plug to 100 - 150 lb-in. (11.298 - 16.948 N.m).

(6) Install packing lubricated with Engine Oil P03-001, to groove on cover.

(7) Insert cover into opening on left side of driveshaft housing. Secure with three bolts, lubricated with Engine Oil P03-001, and washers (Pre SB PW4ENG 75-45 engines) or bracket (Post SB PW4ENG 75-45 engines). Torque the bolts to 62 - 72 lb-in (7.005 - 8.135 N.m).

(8) Install packing lubricated with Engine Oil P03-001, to each end of transfer tube assembly. Install two packings, lubricated with Engine Oil P03-001, to (rear oil) nozzle assembly. Install packing, lubricated with Engine Oil P03-001, to (front oil) nozzle assembly.

(9) Install each end of transfer tube into front and rear nozzle assemblies. Insert nozzles and tube assembly into driveshaft housing (right side of gearbox). Secure nozzles with two bolts, lubricated with
R Anti-Seize Paste P06-054. Remove the unwanted paste. Tighten and torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(10) Install the angle gearbox in the PWA 102112 Support Cradle as follows. See Figure 1002.

  (a) Attach the support cradle (PWA 102112) to the work bench. Put the detail support in the vertical position.

  (b) Put the angle gearbox assembly on the support cradle with the mount lugs in the arms of the cradle. Put the gearbox driveshaft housing on the vertical detail support.

  (c) If necessary, remove the detail screw and loosen the hand knob that attaches the detail-2 plate in the upright position on the base of the cradle. Attach the plate to the storage location on the base.

(11) Install PWA 88697 Fixture on the angle gearbox as follows. See Figure 1002.

  (a) Remove the detail hand knob, thrust bearing, hex nut, jaws, and plunger that are at one end of the detail center rod.

ANGLE GEARBOX - ASSEMBLY-01

(b) Install the detail force gage and center rod subassembly on top of the gearbox.

(c) Install the detail plunger and jaws on the center rod and against the vertical gearshaft.

(d) Install the detail hex nut on the center rod. While you hold the detail jaws and plunger against the gearshaft, turn the detail nut clockwise to expand the jaws against the ID of the gearshaft splines.

(e) Install the detail bracket over the center rod. With the detail pin in the jaws aligned with the slot in the bracket, attach the bracket to the angle gearbox.

(f) Install the detail thrust bearing and hand knob on the center rod. Turn the hand knob until the force gage shows a load of 28 - 32 lb (124.5 - 142.3 N) force.

(g) Tighten the detail screw of the bracket to lock the detail pin in position in the slot.

(12) Attach plate of PWA 85448 Fixture to angle gearbox with six bolts. Slide ring assembly onto coupling outer diameter and secure in place with jaws. Lock in place using nuts. Tighten knob on force gage to exert 28 - 32 lb (124.5 - 142.3 N) force to bearing and gear.

(13) Measure the backlash at the pin. If the gear set in the angle gearbox is Pre SB PW4ENG 72-278, the backlash must be 0.0124 - 0.0262 inch (0.31 - 0.67 mm). If the gear set in the angle gearbox is Post SB PW4ENG 72-278, the backlash must be 0.0116 - 0.0226 inch (0.30 - 0.57 mm).

(14) Remove tooling and install protective closures.

Angle Gearbox Backlash Measurement
Figure 1002
(Task 72-62-00-400-001)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-62-00-400-002:

1. Determine Angle Gearbox Spacers

A. Equipment And Materials Necessary

Special Tools:
PWA 85447 Weight And Holder
PWA 85454 Change Letter C Thickness Gage

Consumable Materials:

	Item No.	Designation
R	P06-054	Paste, Antiseize (PWA 36246)

B. Procedure

Subtask 72-62-00-430-060:

(1) Determine Spacer C. See Figure 1001.

(a) Measure Dimension G on the bevel gear assembly. Write the dimension.

(b) Measure Dimension H. Use PWA 85447 Weight. See Figure 1002.

1 Put the detail rest (No. 1) on a surface plate.

2 Put Bearing R, puller groove up, on the detail rest.

3 Put the weight and holder, three legs down, on the bearing.

4 Look through the slots in the detail rest. Measure and write Dimension H.

(c) Measure Dimension P. Use PWA 85454 Change Letter C Gage.

1 Install PWA 85454 Change Letter C Gage, detail-1, in the angle gearbox housing assembly. Attach it to the housing assembly with the detail bolts and washers.

2 Zero out the indicator, detail-9.

3 Install details−4, −5 and −14 into the gearbox driveshaft housing assembly.

4 Install the gearbox driveshaft housing assembly into the angle gearbox housing assembly. Apply
R Antiseize Paste P06−054 to six bolts. Wipe off
R unwanted paste. Attach the housing assemblies together with six washers and the six bolts. Tighten and torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

5 Adjust the window openings in details−5 and −14 to be able to see the indicator detail−9.

6 Keep close contact between details−1 and −14.

7 Depress spring loaded indicator rod detail−4 to the stop pin detail−7. Rotate the indicator in a clockwise direction over arc on detail−1. Read the difference from the basic setting. Add or subtract, as necessary, this number from 1.7500 inch (44.450 mm). Note the indicator direction. The resulting number Equals P.

(d) Determine J. Refer to the formula below.

FORMULA (INCHES)
J = P + (F − 1.7500) − (G + H) +/− .001
F = See Figure 1003 (F = 3.4500 at assembly at 70 Degrees F).
G = Shoulder−to−shoulder dimension on the bevel gear assembly
H = Dimension on Bearing R with a 9 − 13 pound force applied in Directions K and L. See Figure 1002.
P = 1.7500 inch ± the indicator reading

FORMULA (METRIC)
J = P + (F − 44.450 mm) − (G + H) +/− 0.025
F = See Figure 1003 (F = 87.630 at assembly at 21.15 Degrees C.
G = Shoulder−to−shoulder dimension on the bevel gear assembly
H = Dimension on Bearing R with a 40.0 − 57.8 N force applied in Directions K and L. See Figure 1002.
P = 44.450 mm ± the indicator reading

Subtask 72−62−00−430−061:

(2) Determine Spacer B. See Figure 1001 and Figure 1004.

(a) Measure Dimension M on the bevel gearshaft assembly. Write the dimension.

(b) Measure and write Dimension D. Use Weight PWA 85447. D = Dimension on Bearing N with a 9 − 13 pound force applied in Directions M and N. See Figure 1002.

1 Put the detail rest (No. 2) on a surface plate.

2 Put Bearing N, puller groove up, on the detail rest.

3 Put the weight and holder, four legs down, on the bearing.

4 Look through the slots in the detail rest. Measure and write Dimension D.

(c) Measure and record Dimensions V and W

(d) Determine E. Refer to the formula that follows.

FORMULA (INCHES)
E = (R + S) − (A + M + D) +/− .001
a = See Figure 1005 (A = 3.2200 at assembly at 70 Degrees F).
M = Shoulder−to−shoulder dimension on the bevel gearshaft assembly
D = Dimension on Bearing N with a 9 − 13 pound force applied in the Directions M and N.
R = Dimension stamped on detail−1
S = Dimension V minus Dimension W.

FORMULA (METRIC)
E = (R + S) − (A + M + D) +/− 0.025
a = See Figure 1005 (A = 81.788 at assembly at 21.15 Degrees C.
M = Shoulder−to−shoulder dimension on the bevel gearshaft assembly
D = Dimension on Bearing N with a 40.0 − 57.8 N force applied in the Directions M and N.
R = Dimension stamped on detail−1
S = Dimension V minus Dimension W.

Subtask 72-62-00-430-062:

(3) Grind the spacers to Values J and E. One face of the spacer must be flat within 0.0002 inch (0.0051 mm). The other face must be parallel within 0.0002 inch (0.0051 mm).

C. Postrequisites

(1) Assemble cover, bearing and baffle. See Assembly-03 (Task 72-62-00-400-003).

(2) Assemble angle gearbox bevel gearshaft assembly and gearbox driveshaft housing assembly. See Assembly-04 (Task 72-62-00-400-004).

(3) Assemble angle gearbox bevel gear assembly and angle gearbox housing assembly. See Assembly-05 (Task 72-62-00-400-005).

(4) Assemble angle gearbox. See Assembly-01 (Task 72-62-00-400-001).

ANGLE GEARBOX - ASSEMBLY-03

Task 72-62-00-400-003:

1. Assemble Cover, Bearing And Baffle

A. Equipment And Materials Necessary

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	4	72-62-00/3/170
Packing	1	72-62-00/3/100
Packing	1	72-62-00/3/190

B. Procedure
See Figure 1001.

Subtask 72-62-00-430-051:

(1) Put the cover assembly on a bench, packing groove up.

(2) Put the bearing outer race in the cover assembly.

(3) Put the baffle on the bearing outer race. Refer to the referenced figure for correct orientation of the baffle.

(4) Attach the baffle and bearing outer race to the cover assembly.

R (a) Apply Antiseize Paste P06-054 to four bolts. Wipe
R off unwanted paste.

(b) Attach the baffle and bearing to the cover assembly with four key washers and the four bolts.

(c) Tighten and torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m). Bend the tabs of the key washers.

(5) Apply Engine Oil P03-001 to a packing. Install the packing in the groove in the cover assembly.

(6) Attach the packing cover to the cover assembly.

  (a) Apply Engine Oil P03−001 to a packing.

  (b) Put the packing in the groove of the packing cover.

R R (c) Apply Antiseize Paste P06−054 to two bolts. Wipe off unwanted paste.

  (d) Attach the packing cover to the cover assembly with two washers and the two bolts. Tighten and torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(7) Put a cover over the assembly to protect it until you install it.

C. Postrequisites

(1) Assemble angle gearbox bevel gearshaft assembly and gearbox driveshaft housing assembly. See Assembly−04 (Task 72−62−00−400−004).

(2) Assemble angle gearbox bevel gear assembly and angle gearbox housing assembly. See Assembly−05 (Task 72−62−00−400−005).

(3) Assemble angle gearbox. See Assembly−01 (Task 72−62−00−400−001).

ANGLE GEARBOX - ASSEMBLY-04

Task 72-62-00-400-004:

1. Assemble Angle Gearbox Bevel Gearshaft Assembly And Gearbox Driveshaft housing Assembly.

A. Prerequisites

(1) Determine spacer thickness. See Assembly-02 (Task 72-62-00-400-002).

B. Equipment And Materials Necessary

Special Tools:
PWA 85413 Base
PWA 85414 Wrench
PWA 85424 Drift
PWA 85924 Drift

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	1	72-62-00/4/100
Key Washer	2	72-62-00/4/150
Key Washer	2	72-62-00/4/160
Packing	1	72-62-00/4/120

C. Procedure
See Figure 1001.

Subtask 72-62-00-430-052:

(1) Place driveshaft housing (1001/1) on bench with the bolt hole flange up. Insert roller bearing outer race (1001/2) into housing, aligning bolt holes.

R (2) Install four bolts, threads lubricated with Antiseize
R Paste P06-054, to secure bearing. Wipe off unwanted
R paste. Tighten and torque bolts to 62 - 72 lb-in.
(7.005 - 8.135 N.m). Bend tabs of key washer to secure bolts.

NOTE: Place key washers so that they are horizontal in flight position.

(3) Trunnion housing so that the bolt hole flange is down. Install ball bearing and outer race (1001/3) into housing, aligning bolt holes.

R (4) Install four bolts, threads lubricated with Antiseize
R Paste P06-054, with key washers to secure bearing.
R Wipe off unwanted paste. Tighten and torque bolts to
62 - 72 lb-in. (7.005 - 8.135 N.m).

Subtask 72-62-00-430-053:

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER GEARSHAFT. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-278.

(5) Place bevel gear (1001/7) on PWA 85413 Base, gear teeth down.

(6) Install the roller bearing inner race (1001/6) onto bevel gear, mating number down. Using PWA 85424 Drift with arbor press, push bearing down to seat on gear shoulder.

(7) Install spacer (1001/5) over gear to rest on shoulder.

NOTE: Spacer thickness should have been previously determined per Assembly-02 (Task 72-62-00-400-002).

(8) Install ball bearing inner race front (1001/4) over shaft to rest against spacer. Use PWA 85924 Drift with arbor press to seat race.

(9) Position housing and bearing over bevel gear and slowly engage bearings.

(10) Install ball bearing inner race rear (1001/11), puller groove up, over bevel gear and, using PWA 85924 Drift with arbor press, seat the inner race.

Subtask 72-62-00-430-054:

(11) Install coupling (1001/10), engaging splines of coupling with splines on gear.

(12) Install key washer (1001/8) and nut (1001/9) to retain coupling. Using PWA 85414 Wrench, torque nut to 2800 - 3000 lb-in. (316.357 - 338.955 N.m) using standard torque wrench. Loosen to zero. Retorque nut to 2800 - 3000 lb-in. (316.357 - 338.955 N.m). Bend key washer tabs.

(13) Install packing, lubricated with Engine Oil P03-001, to groove in housing.

(14) Cover the assembly until needed for angle gearbox assembly.

D. Postrequisites

(1) Determine angle gearbox spacers. See Assembly-02 (Task 72-62-00-400-002).

(2) Assemble cover, bearing and baffle. See Assembly-03 (Task 72-62-00-400-003).

(3) Assemble angle gearbox bevel gear assembly and angle gearbox housing assembly. See Assembly-05 (Task 72-62-00-400-005).

(4) Assemble angle gearbox. See Assembly-01 (Task 72-62-00-400-001).

(Task 72−62−00−400−004)

Task 72-62-00-400-005:

1. Assemble Angle Gearbox Bevel Gear Assembly And Angle Gearbox Housing Assembly

A. Prerequisites

(1) Determine spacer thickness. See Assembly-02 Task 72-62-00-400-002.

B. Equipment And Materials Required

Special Tools:

PWA 21500	Adapter
PWA 85417	Base
PWA 85418	Wrench
PWA 85423	Drift

Consumable Materials:

	Item No.	Designation
R	P05-232	Crayon, Metal Marking (PMC 4058)
	P06-054	Paste, Anti-seize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	1	72-62-00/3/30
Key Washer	1	72-62-00/3/180

C. Procedure
See Figure 1001.

Subtask 72-62-00-430-055:

(1) Attach PWA 21500 Adapter to a workbench. Attach PWA 85417 Base to the adapter.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER GEAR. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-278.

(2) Place angle gearbox bevel gear assembly (1001/2) on the base, gearteeth up. Install inner race and rollers (1001/1) to gear. Using PWA 85423 Drift and arbor press, seat bearing against gear shoulder.

Subtask 72-62-00-430-056:

(3) Turn gear and bearing to gearteeth down. Install spacer (1001/5) over shaft to rest on gear shoulder.

NOTE: Spacer thickness should have been previously determined by Assembly-02 (Task 72-62-00-400-002).

(4) Install bottom inner race of ball bearing (1001/6) to rest against spacer. Use PWA 85423 Drift and an arbor press to seat race. Install outer race and balls to rest on just installed inner race. Install upper inner race (puller groove up) and using PWA 85423 Drift and an arbor press seat race on bearing.

(5) Install the key washer (1001/4) and nut (1001/3) to retain the bearing. Make a mark on the key washer and a mark on the bevel gear assembly in line with each other with a Metal Marking Crayon P05-232. With PWA 85418 Wrench torque the nut (1001/3) to 1280 - 1920 lb-in. (144.621 - 216.931 N.m). Loosen to zero. Torque the nut (1001/3) again to 1280 - 1920 lb-in. (144.621 - 261.931 N.m), then turn 14 - 18 degree angle of turn with a standard torque wrench. Make sure the crayon marks are aligned.

(a) If the crayon marks do not align, loosen the nut and install a new key washer and do the torque procedure again.

(b) If the marks are aligned, make two dimples, 180 degrees apart, in the side of the key washer (1001/4) with a round bottom drift. Make sure the dimples extend into the wrench slots of the nut. Refer to Section 70-53-00 in the Standard Practices Manual, PN 585005.

Subtask 72-62-00-430-057:

(6) Place angle gearbox housing assembly on bench bottom end up.

(7) Install bevel gear and bearings into housing aligning bolt holes in bearing flange with holes in housing.

ANGLE GEARBOX - ASSEMBLY-05

(8) Install three bolts, threads lubricated with Antiseize Paste P06-054, with key washer to secure bearing to housing. Wipe off unwanted paste. Tighten and torque bolts 125 - 140 lb-in. (14.123 - 15.818 N.m). Bend tabs of key washer to secure bolts.

NOTE: Place center bolt of key washer facing rearward.

(9) Cover assembly until needed for angle gearbox assembly.

D. Postrequisites

(1) Determine angle gearbox spacers. See Assembly-02 Task 72-62-00-400-002.

(2) Assemble cover, bearing and baffle. See Assembly-03 Task 72-62-00-400-003.

(3) Assemble angle gearbox bevel gearshaft assembly and gearbox driveshaft housing assembly. See Assembly-04 Task 72-62-00-400-004.

(4) Assemble angle gearbox. See Assembly-01 Task 72-62-00-400-001 .

Pratt & Whitney

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.
